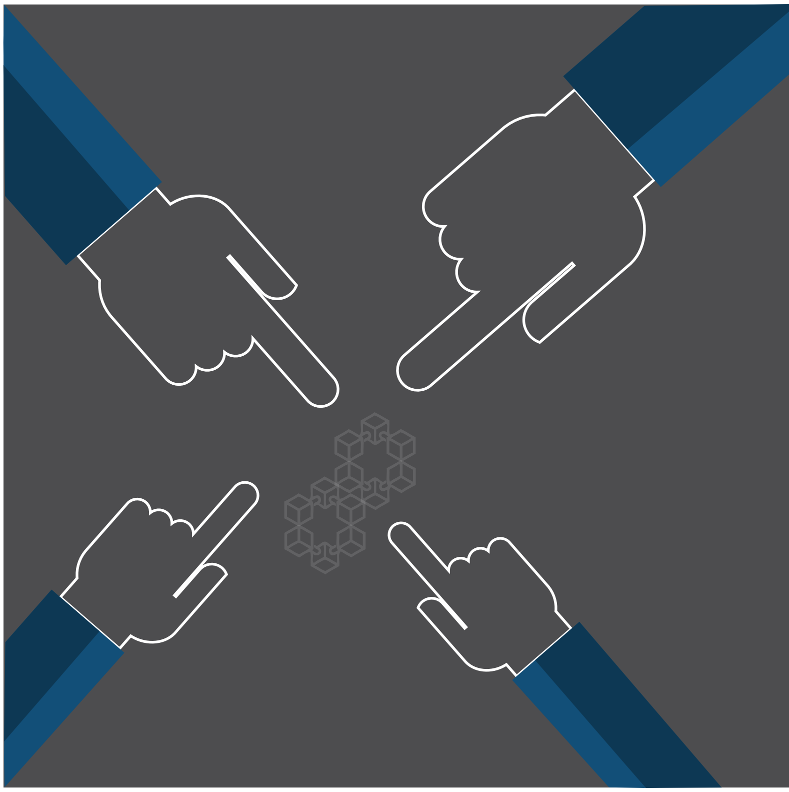
Implementing Blockchain For Large Enterprise Solutions



Blockchain consortia are creating a massive hype in the market. Many enterprises are highly interested in this type of network and willing to join consortia to gain optimal benefits of blockchain technology. However, there are still lots of unknown facts regarding how a consortium works and how it is governed, etc

Dr Anand Nayyar and Dr Magesh Kasthuri

Till recently, the focus was mainly on governance solutions for public blockchain platforms like Hyperledger and Ethereum. Consortium blockchain governance, however, will become as or even more important to enterprises than public blockchain governances because these will work with this level of governance on daily basis.

It is important to understand that there is no universal sort of blockchain governance. It all depends on the type of blockchain solution that companies can use. There are three main types of blockchain systems: open or public, private or permissioned, and consortium or federated blockchains. Public and private blockchains are all known to the general audience, but consortium blockchain needs more understanding.

Blockchain consortium, is defined as a type of network where multiple organisations maintain the system. A group of companies thereby collaborates on advancing the state of blockchain technology adoption in the industry, establishing industry standards, drafting use cases, developing key infrastructure, and operating commercial blockchain platforms.

Consortium blockchains are termed as 'Hybrid Solutions,' in-between public and private, that is, between fully open decentralised systems and fully centrally controlled, thus taking the best of both the worlds. Rather than one organisation,
