1 THE FIRST HIGH VOLTAGE ELECTRIC 2-WHEELER IN INDIA

Kaynes Technology, a major player in India's electronics manufacturing services, is a strategic investor in Raptee. They are also contracted to manufacture specific components for Raptee

Raptee Founding Team

Unlike all the electric two-wheelers being sold in India currently, Raptee's first electric high-speed electric two-wheeler (E2W) motorcycle will be a high voltage one. Dinesh Arjun, Co-founder & CEO of Raptee Energy, in a conversation with Electronics For You, said, "We will target the 250cc category of motorcycles in India with our first product. It will be priced somewhere close to ₹250,000."

The biggest USP of this motorcycle, and most other Raptee products, as Arjun explained, would be their capability to get charged at combined charging system (CCS) standard electric vehicle chargers. Currently, only electric cars available in India can do so. "This will ensure that Raptee products can leverage existing fast chargers in the country. We will be the only ones to do long highway travels on our motorcycles because of these chargers," he says.

Arjun adds, "Most of the E2Ws available in India are based on drivetrains that support 36 to 96V DC, whereas our first motorcycle is based on 246V DC. This simply means that we will be able to charge it at any fast charger deployed out there." Further, the startup says it has designed and developed the majority of components in-house for its two-wheelers. Barring cells, it has 'control' over everything else that is going into motorcycles they are building. Kaynes Technology, one of India's most prominent contract electronics manufacturing services providers, is a strategic investor in Raptee and is also contract manufacturing certain components for the same.

Raptee says it is also creating a database of all the motorcycles it plans to deploy on the road. This data, powered by AI and ML, will be used to 'not repeat' mistakes a particular model is making in other variants. Sensors fitted on the motorcycles not only collect data at the vehicle but also at the component level. Arjun terms the practice as creating "hives of Raptee motorcycles."

He adds, "We are testing dynamic deployment of algorithms. This
