

tors, designed to enhance RF signal control in various applications. These attenuators offer a wide attenuation range from 0dB to 30dB, catering to the demands of modern RF systems in telecommunications and aerospace. With an operational frequency range up to 26GHz and capabilities extending to 33GHz, they provide unmatched accuracy and reliability in high-frequency environments. Key features include linear characterisation for consistent amplitude and phase, superior return loss performance for reduced signal reflections, and enhanced system efficiency.

Bluetooth LE-LR module

Infineon Technologies AG has unveiled the CYW20822-P4TAI040, a Bluetooth module designed for IoT and consumer electronics. This cost-effective module enhances wireless connectivity with its support for Bluetooth low energy long range (LE-LR), making

it suitable for a variety of applications including industrial IoT, smart home devices, asset tracking, beacons, sensors, and medical equipment. The module offers features like Bluetooth 5.0 support, long-range connectivity, low power consumption, and a compact size.

DC/DC modules with integrated transformers

Texas Instruments has launched two innovative power conversion device portfolios to enable engineers to achieve higher power density in

compact spaces while reducing costs. The 100V integrated gallium nitride (GaN) power stages feature thermally enhanced dual-side cooled package technology, providing industry-leading power density exceeding 1.5kW/in³. These 1.5W isolated DC/DC modules with integrated transformers set industry standards as the smallest and most power-dense solutions, significantly reducing the size of isolated bias power supplies in automotive and industrial systems by over 89%.

Fine-increment HF inductors

TDK Corporation has launched the MHQ1005075HA series of inductors for the automotive industry. These inductors, designed for high-frequency circuits in automotive applications,

feature a compact size and a wide range of inductance values. Utilising the company's proprietary design expertise, the series employs a multilayer method for fine inductance increments and offers a broad operating temperature range. Meeting AEC-Q200 standards, they ensure high reliability and safety

in automotive environments. They are ideal for high-frequency circuits in automotive equipment, such as telematics and V2X, as well as in radio communications for smartphones, tablets, and base stations.

Single-cell thermal printhead

ROHM's KR2002-Q06N5AA thermal printhead enables high-quality printing with a single-cell Li-ion battery (3.6V), reducing energy consumption by 30%. This innovation meets the

growing demand for efficient, portable printers in electronic

money transactions and mobile labeling. Unlike traditional 2-cell battery printers, ROHM's printhead offers comparable print quality while being more compact and energy-efficient. It features a new design for optimised heat element and protective film, achieving 203 DPI resolution and 50mm/s printing speed with significant energy savings.

EMBEDDED

Development kit for RISC-V

Microchip Technology's PolarFire SoC Discovery Kit caters to the demand for open source RISC-V architectures in the embedded industry. It features a quad-core RISC-V processor, 95k FPGA logic elements, and multiple peripherals for embedded processing and compute acceleration. Supporting Linux and
