

real-time applications, the kit enables firmware development, application testing, and code programming and debugging. The kit is based on the PolarFire MPFS095T SoC FPGA, offering a 64-bit CPU cluster, configurable L2 memory, AMP mode support, and various connectivity options like MikroBUS, Raspberry Pi, and MIPI video connectors. It also includes an embedded FP5 programmer for FPGA fabric programming and debugging.

Efficient edge computing FPGAs

AMD has introduced the Spartan UltraScale+ FPGA family, enhancing its FPGA and adaptive SoC range. These devices, designed for edge applications, offer an optimal I/O to logic cell ratio for 28nm and smaller process technologies, ensuring cost and power efficiency.

They feature advanced security measures, including Post-Quantum Cryptography, a physical unclonable function, and protection against differential power analysis, to safeguard against cyber threats. With up to 572 I/Os, support for voltages up to 3.3V, and compact packaging options, these FPGAs are ideal for edge sensing and control.

SoC-powered SOM

MYIR has introduced the MYC-LT527 SoM, powered by the Allwinner T527 SoC, featuring an Octa-core ARM

Cortex-A55 CPU (up to 1.8GHz), a G57 MC1 GPU, and a 2 TOPs NPU for AI. It

includes 32kbit EEPROM, a PMIC, and a 381-pin LGA interface. It supports Android and is suitable for industrial

robots, energy systems, medical equipment, etc. It also has a RISC-V CPU (up to 200MHz). For evaluation, MYIR offers the MYD-LT527 development board with various interfaces for connectivity and expansion.

Wi-Fi and Bluetooth development board

The ADIY Ai WB2 12F dev-Kit is designed for Wi-Fi and Bluetooth

modules, featuring a BL602 chip that supports Wi-Fi 802.11b/g/n and BLE 5.0 protocols. With 276kB RAM and various interfaces like SDIO and UART, it is ideal for IoT, mobile devices, and smart

homes. It offers security protocols like WPA3, Bluetooth mesh, and multiple sleep modes for power management. Suitable for IoT developers, educational institutions, and startups, it supports universal AT commands and integrates with Windows and Linux environments.

MANUFACTURING EQUIPMENT

Piezo dispensing system for biomolecules

VERMES Microdispensing has launched the MDS 3080 series, a piezo dispensing system for low to medium-

viscosity materials, suitable for biomolecules, 3D living organ analogues, protein solutions, and DNA arrays.

It features micro-shot, contact-free jet dispensing technology, a stable and adjustable valve for precise handling, interchangeable tappets for shot size flexibility, and a modular design for easy maintenance. The Bayonet fluid

box body design reduces downtime during media changes. The highlight of this system is its precision and efficiency for industrial production.

TEST & MEASUREMENT

High-speed line inspection system

Test Research, Inc. (TRI) introduced the ultra-high-speed 3D AOI TR7700QH SII, capable of inspecting at speeds up to 80cm²/sec with excellent Gauge R&R. This model features AI-powered inspection algorithms,

metrology-grade measurements, and a 21MP high-speed sensor for imaging

resolution as fine as 15µm. It also boasts multi-phase true-colour LED lighting and quad digital fringe projectors for 3D capabilities. Additionally, TRI will present its multi-angle 3D AOI TR7500QE Plus, designed to detect hidden solder joint defects, the enhanced 3D SPI TR7007Q SII, the high-throughput 3D AXI TR7600 series, and the Multi-core ICT TR5001Q SII INLINE.

Digital storage oscilloscopes

The SIGLENT SDS3000X HD series digital storage oscilloscopes offer bandwidths up to 1GHz, with 12-bit ADCs, and sampling rates up to 4GSa/s. They feature a maximum record length of 400Mpts/ch, displaying up to 4 analogue channels and 16 digital channels.

Unique capabilities include mixed signal analysis, waveform capture rates up to

200,000wfms/s, and a digital trigger system with high sensitivity. The series supports various measurement
