

ers who leave their service. DotDot offers a solution by allowing users to sell their unused data, helping them stay active on their network. Additionally, DotDot enables mobile operators to reach populations lacking internet access, potentially increasing their customer base by introducing them to connectivity benefits.

In which parts of the world is this deployed?

This is a marketplace. We are starting by building communities. We go to university campuses, NGOs, and other institutions to form partnerships. Moreover, we are in talks with some mobile phone operators in France. We have also started exploring the Indian market.

Apart from the device cost, where does your revenue come from?

Users only need to pay for the hardware upfront, with no subscription fees. DotDot earns revenue by taking a commission on transactions. Initially, a significant portion of users choose to share their gigabytes for free, with the majority eventually opting to trade them.

Are there any other use cases for this device?

DotDot devices can create decentralised networks that are private or public, allowing teams to stay connected without internet access. These networks have applications in defence, mining, remote areas, and low-latency environments. DotDot also has potential uses in manufacturing, replacing costly communication devices between equipment. Additionally, DotDot is exploring applications with special forces for their unique communication needs.

What are some possible use cases in India?

In the Indian market, defence, manufacturing, and the automotive industry are our biggest markets! While use cases for the defence industry are sensitive, in manufacturing, the mesh networks can easily replace other-wise expensive equipment. In the automotive industry, one device can be installed per vehicle and then used for over-the-air updates.

Where is the device manufactured? Also, please highlight the components being used.

The manufacturing is in France, with some components sourced from Taiwan. We are working to diversify our sourcing with embedded hardware-agnostic software. All hardware parts are manufactured in France. For software, we are partnering with an Indian company called Infinity Solution based in Coimbatore. We do not rule out the possibility of a manufacturing line in India. **EFY**

An “AWESOME” Development Board from India?

- **Super Small:** 3 centimeters
- **Super Smart:** 3 processors
(Xtensa® Microprocessor + 2 ULP RISC-V Coprocessor)
- **Super Sensitive:** 4 Sensors
- **Super Connected:** Wifi & 10+ Interfaces
- **Super Flexible:** 30 GPIOs
