ance of liquid fertilisers. Common indicators such as phenolphthalein, methyl red, and bromothymol blue are utilised to indicate pH ranges of approximately 8 to 10, 4.5 to 6, and 6 to 7.5, respectively. Phenolphthalein transitions from colourless to pink, while methyl red transitions from red to yellow. This term, widely used in chemistry, biology,

and agronomy, translates the concentration values of hydrogen ions, typically ranging between about 1 and 10^{-14} gram-equivalents per litre, into a scale from 0 to 14.

The pH of a solution can be calculated by taking the negative logarithm of the hydronium ion concentration, expressed as $\text{pH} = -\log[\text{H}_3\text{O}^+]$. At 25°C, a solution with
