manufacturing in India over the years. Customers in the US generally show no objections to products manufactured in India, unless there are legal restrictions in the US for certain critical applications. In such cases, customers are content with us to manufacture in India and ship the products to them. Prominent US and European customers have visited our facility, expressing satisfaction with the quality and supply chain we have maintained over the past five to six years. We are in a sweet spot right now and I believe now is the perfect time to expand this ecosystem.

What would your advice be, as a player who has successfully transitioned from a design services startup to a manufacturing company, to startups who aspire to do the same?

For me, the concept is quite simple. The key focus should be on creating an IP, a unique USP that can be marketed. The challenge lies in determining what that specific IP will be and identifying the target market for selling it. The unique USP attracts customers, leading to necessary funds for building the supply chain and production. It is essential to balance attention between solving a problem and developing a marketable IP. Startups with an IP must understand the problem it solves, while those focusing on a problem must not neglect the development of a unique IP. Startups should invest in R&D, building their own IP gradually while understanding customer's needs. This approach, when applied in India, will improve the efficiency of the startup ecosystem over time.

How was your experience here at India Electronics Week?

India Electronics Week has been a hectic yet wonderful day for me.

It provided an excellent opportunity to meet numerous people I was connected with but hadn't met before. I had the pleasure of reconnecting with old colleagues, bosses, and mentors, even shaking hands with them, which was a delightful experience. Witnessing such a vast array of electronics during the show was truly exhilarating for me. Overall, it has been a very pleasant day. The future of embedded vision and the entire market is poised for significant growth, presenting ample opportunities for many. As a country and as electronics engineers, it is crucial for all of us to focus on building expertise in IT. This applies not only to the vision-related areas but across various domains. Embracing and developing IT skills will be key to thriving in this evolving landscape.

When it comes to embedded vision, what would you like to see in this industry?

I would like to see more companies in India focusing on technologies or startups that complement and support existing products and systems. I believe there is a great opportunity for companies using algorithmic solutions or computer vision algorithms to address specific challenges in various market, including automated mobile robots (AMR) market and retail. Indian companies should focus on leveraging algorithmic solutions and computer vision algorithms to complement existing products and systems, particularly in sectors like AMR and retail. Tailored automation solutions for the Indian market can enhance efficiency and tap into abundant human resources. This initiative not only benefits India but also encourages international partnerships and business opportunities, facilitating the sale of products like cameras within the Indian market. **EFY**
