

10x faster Lowcode for IoT & Embedded Systems.

Free Marketplace

- Libraries.
- Projects.
- Micro-controllers.

Complex Coding

- Create functions.
- Modular files.
- Easy arithmetic.

**Industry Grade**

- Deep tech settings.
- Intact Performance.
- Auto-scheduling.
- Code Ownership.

Competitive

- 11x faster coding.
- 3 days to learn.
- 3x maintainability.

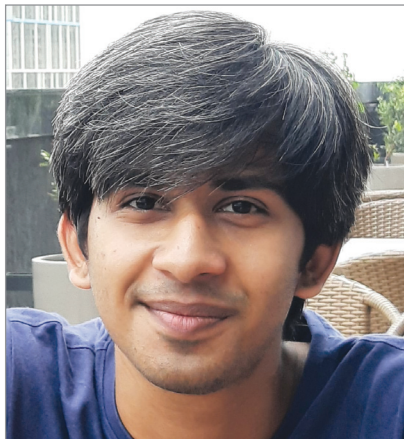

Smowcode Bus presentation

multiple flows to execute simultaneously and independently. If the connected activity node hasn't finished its task, events triggered by event nodes are stored in a queue.

"Smowcode offers a graphical approach to coding. We created a calculator project using the platform's extensive library of components and functionalities, which features a keypad and performs addition and subtraction based on user input, displaying the result on the screen," shares Mewada.

To ensure compatibility with various microcontrollers, Smowcode has accommodated different preferences and loading methods specific to each microcontroller. The platform uses just enough RAM to deploy the code and requires no fixed firmware or bootloader. "Different microcontrollers may have distinct loading procedures. We are rapidly integrating support for newer MCUs from the same and different manufacturers," states Mewada.

"Once the flow has been created, by clicking upload, a user can facilitate the creation of a binary file from the code snippet, which is then uploaded automatically to the microcontroller. A separate .bin download button is present to simply download the binary to flash it separately in

*Adhik Mewada, Founder, Smowcode*

production," explains Mewada.

While Mewada's peers were learning how to code, the young entrepreneur was busy creating one, with very few references to understand the process of software release and creating setup files. "Engineering education typically focuses on web applications, neglecting crucial aspects like setup file creation. Additionally, mastering graphics for UI design presented further challenges. The main hurdle was the lack of comprehensive references. Finding references for coding language creators was daunting," he explains.

The platform offers both free and premium versions, with the premium version catering mainly to

corporate clients who require extensive usage capabilities. The free version is available with minimal limitations, enabling rapid project development. Users can also request additional features or libraries, which the company is actively working on. "For corporates, the premium version provides significantly higher usage limits, akin to a SaaS model but with a setup file installation process. Users can install that file and then rely on the internet for code compilation and burning it onto their microcontrollers. This setup minimises compilation and tool generation issues commonly encountered during programming," the young entrepreneur adds.

The startup has collaborated with a few small-sized companies focusing on IoT gateway development and has experimented with coding some of their IoT gateway products using Smowcode. It has also partnered with companies providing embedded systems services. "Several pilot projects are underway with these companies, as they explore utilising our software for their development needs. Several enterprises have reached out to us to explore Smowcode's potential for mobile development and other applications. Smowcode was instrumental in enabling an IoT Device Project for a company to
