Radar sensor for ADAS

Texas Instruments unveiled semiconductor solutions to enhance automotive safety and intelligence, including the AWR2544, a 77GHz millimetre-wave radar sensor chip for advanced driver assistance systems (ADAS). This radar sensor is pioneering for

satellite architectures, delivering semi-processed data for ADAS decision-making and offering 360-degree sensor coverage. It features launch-on-package (LOP) technology, reducing sensor dimensions by up to 30% and extending sensor ranges beyond 200 metres. The company's driver chips enhance control of high-voltage circuits in battery management systems (BMS) and powertrain systems. These innovations aim to advance vehicle safety and intelligence, making ADAS more capable and powertrain systems smarter.

Global shutter image sensor

STMicroelectronics enhances smart computer vision with its latest global shutter image sensor, suitable for

distortion-free imaging in dynamic or near-infrared settings. At

2.7mm x 2.2mm, it offers 800 x 700 resolution, low power usage, global shutter, -30°C to 85°C operating range, wake-up with scene detection, and high frame rates. The sensor

supports events like image streaming, simplifies post-processing with native background removal, and operates at 1mW in 'always-on' mode. It suits smart glasses, AR/VR headsets, robotics, and smart home devices. Its advanced semiconductor processes result in a class-leading pixel size of 2.16µm, enhancing sensitivity and reducing crosstalk. The device is I3C-controlled, allowing ten times faster communication, and offers multiple auto-exposure modes, high frame rate operation, flexible tone mapping, and advanced features.

Fuse blocks for 5×20mm fuses

Littelfuse, Inc. introduces the updated 656 and 658 series fuse blocks product line. These fuse blocks support higher amperage ratings, enhancing flexibility

for electronics engineers and designers. The series fuse blocks present a range of features, including options for both PCB-

mounted and surface-mounted configurations designed to accommodate 5 × 20mm fuse sizes. This extended range allows diverse industries to precisely match their amperage requirements. Littelfuse upgraded 656 and 658 series fuse blocks to cater to consumer electronics, data centres, telecommunications, home automation, appliances, HVACR systems, industrial settings, and electrical equipment.

Wi-Fi 6E and Bluetooth module

U-blox has introduced the JODY-W6, a compact module measuring just 13.8mm × 19.8mm × 2.5mm, specifically designed for the automotive sector. This versatile module caters to various automotive applications,

including in-car entertainment, connectivity, telematics, and more. It boasts

dual Wi-Fi 6E connectivity, seamless Bluetooth LE audio integration, simultaneous Wi-Fi and Bluetooth operation, and robust security and encryption features. The JODY-W6 aligns with the TSR Wireless Connectivity Market Report, highlighting the growing importance of Wi-Fi 6 and 6E in the automotive industry. This module supports dual-mode Bluetooth with LE audio capabilities and can withstand extreme temperatures ranging from -40°C to 105°C.

Cybersecurity chip

Microchip Technology has unveiled the trust anchor security integrated chip (IC) known as TA101, catering to both industrial and automotive appli-

cations. This versatile IC meets stringent cybersecurity standards mandated by governments and automotive OEMs

and is AEC-Q100 Grade 1 qualified. The TA101 collaborates seamlessly with microcontrollers (MCUs) and microprocessors (MPUs), assuming control of critical cryptographic operations such as public key infrastructure,
