

“We Refer To The 28-NANOMETRE NODE As The ‘GOLDILOCKS’ NODE”

Incubated at IIT Madras, the fabless semiconductor startup, Mindgrove Technologies, has developed a microcontroller chip operating on a 28-nanometre technology node with a SHAKTI core, at a speed of 700MHz for IoT applications, signal processing, machine learning, and characterisation in signal processing and vision domains. The chip leverages built-in security features and enhanced performance for tasks like fingerprint scanning and high-speed motor control, facilitating feedback and control on a single chip. In an exclusive chat with EFY’s Yashasvini Razdan, co-founders Shashwath T.R. and Sharan Srinivas J. dished out interesting details about technology nodes in chip design
