

sified as Class 0.5 instruments, they have a display with annunciators for readability. These meters are versatile and suitable for various uses, eliminating errors. The design uses microcontrollers and surface mount technology, eliminating potential inaccuracies from moving parts. Four models cater to AC and DC measurements, offering multiple ranges. They have USB connectivity and a user-friendly software. They function as a master standard meter for verifying secondary standard meters.

Digital storage oscilloscopes

Siglent has unveiled its SDS7000A series of digital storage oscilloscopes, offering a variety of bandwidth options of 4GHz and 3GHz. These oscilloscopes are equipped with 12-bit

ADCs and boast a sampling rate of up to 20GSa/s. They have an advanced digital trigger system,

characterised by high sensitivity and minimal jitter. This system supports various triggering modes. The scopes are well-equipped for comprehensive waveform analysis, offering a range of essential tools, including history waveform recording, search and navigation functions, signal scan, mask test, bode plot, power analysis, eye/jitter analysis, and compliance test. These tools facilitate detailed capture, storage, and analysis of extended waveform records.

Waveguide calibration kits

Infinite Electronics subsidiary Pasternack has recently unveiled a lineup of waveguide calibration kits, designed to

meet the needs of RF, microwave, and millimetre-wave professionals. These kits are specifically tailored for WR-90, WR-75, WR-62, WR-34, WR-28, and

WR-22 waveguide sizes, and they include essential components such as waveguide-to-coax adaptors,

precisely matched waveguide terminations, and a variety of precision waveguide sections. Customers can select between two robust material options: durable aluminum or sturdy brass, depending on the specific waveguide size.

EMBEDDED

Advanced microcontrollers

Nuvoton has introduced two advanced microcontroller series: the M463 CAN FD/USB HS Series and the M467

Ethernet/Crypto Series. These microcontrollers play a crucial role in a wide range of applications, including IoT gateways, industrial control systems, telecommunications, data centers, smart grid management, motor control for household appliances, small TFT LCDs, and TinyML (machine learning) devices. These products are compatible with third-party integrated development environments (IDEs). Both microcontroller series support various RTOS and GUI libraries.

Market-ready NB-IoT ML SOM

Eoxys has unveiled XENO+ NB-IoT ML system-on-module (SOM), designed to seamlessly power advanced IoT and AI/ML devices. This highly adaptable SOM caters to a wide array of applications, encompassing smart

metering, intelligent lighting, precision tracking, and industrial automation, thus marking a stride in the

industry's progress. The SOM excels in energy efficiency and incorporates an integrated EAL5+ secure element (SE)

to guarantee top-tier security, a critical requirement for safeguarding applications like intelligent energy and water metering systems. This all-encompassing ecosystem empowers developers to delve into and implement avant-garde AI/ML solutions in IoT applications, laying the foundation for groundbreaking innovations in the field.

MANUFACTURING EQUIPMENT

Piezo Xtreme 2 jetting systems

VERMES Microdispensing introduces the MDS 3500 Piezo Xtreme 2 jetting systems, designed for robust applications in tough environments. In industries where consistent media

application is crucial, dispensing repeatability is essential. It transforms various

sectors requiring precise, contactless dispensing of intricate patterns in small quantities while maintaining drop accuracy despite external variables. Customisation options are available, with a variety of tappets and nozzle inserts tailored to diverse applications in automation, electronics, mechanical engineering, automotive, medicine, pharmaceuticals, IT, and consumer electronics.
