

base, designed for precision, especially in nano and optoelectronics. The photonics bonder, built on a granite machine platform, is a place-

ment system. It allows integration with all assembly and connection technologies that Tresky offers, including eutectic soldering or UV bonding. The modular bonder enables customisation for specific customer needs and is suitable for prototyping, product development, and series production in nano and optoelectronics. The photonics bonder can also accommodate optional bonding forces, making it suitable for hybrid bonding or sintering applications.

ENTERPRISE SOLUTIONS

Programmable AC power supplies

ONsys Technologies OPC Pvt Ltd has launched programmable AC power supplies, vital for industrial and research applications, offering precise control over voltage, current,

and frequency. They ensure product compliance with international standards, adapt to various power scenarios, and with their ability to precisely adjust voltage, current, and frequency, these power supplies are indispensable in customising power delivery for specific applications, from aerospace to telecommunications. Their importance also extends to educational environments, where they serve as practical tools for teaching complex electrical engineering concepts.

Graphics card featuring M.2 slot

ASUS has introduced the world's first graphics card featuring an M.2 slot, known as the Dual GeForce RTX 4060

Ti Solid State Drive (SSD). This design allows for a cooling upgrade while accommodating high-performance NVMe drives, marking advancement in graphics card technology. One of the SSD's key advantages is its dual Axial-tech fans, which not only keep the graphics card cool during gaming but also effectively reduce the operational temperatures of the M.2 drive. This sets it apart from traditional motherboard M.2 slots. ASUS's testing has revealed that attaching M.2 drives to the SSD results in temperatures up to 40% lower than those observed with standard motherboard-mounted M.2 slots, ensuring extended sustained read/write performance and long-term stability.

Cloud AI inference card

Qualcomm has unveiled the Qualcomm Cloud AI 100 Ultra, to its cloud artificial intelligence (AI) inference

card lineup. This card is purpose-built for handling generative AI and large language models (LLMs).

It boasts up to four times the performance of its predecessor thanks to Qualcomm's advanced AI cores. The card can efficiently support models with 100 billion parameters on a single 150-watt card and models with 175 billion parameters using two cards. This programmable AI accelerator seamlessly adapts to evolving

AI advancements and data formats, integrating with the Qualcomm AI Stack for easy model porting and optimisation. In various applications, it delivers superior performance per total cost of ownership (TCO) dollar compared to competitors in generative AI, LLMs, NLP, and computer vision workloads.

Slim light

Halonix Technologies has recently unveiled 'Wall De-light,' ushering in a new era of lighting solutions. It is six

times slimmer than traditional LED bulbs, instantly enhancing the visual appeal of any space. The

'Wall De-light' is mounted flush with the wall, delivering a clean and contemporary look. The simplicity of installation makes it accessible to a wide range of users. Its slim design, ease of installation, competitive pricing, and commitment to quality make it a choice for those seeking to elevate their interior spaces with sophisticated and efficient lighting solutions.

High-speed labelling system

Sciencscope has introduced labelling systems that can label component reel barcodes with lightning speed and

integrates data into MES systems. It creates fresh labels, prints them, and affixes

them to the reels—all within a moment's notice. Boasting a 95% success rate in reading various barcode types, the IMS-200 is not just the future, it is the present reality.
