

TECH THAT WILL THRIVE IN 2024: AI And Beyond

Predicting technology is like forecasting the weather! Who knows what tomorrow will bring. Yet, like the brave weathermen, we shall do our bit to prepare you for what might be...

JANANI G. VIKRAM is a freelance writer based in Chennai, who loves to write on emerging technologies and Indian culture. She believes in relishing every moment of life, as happy memories are the best savings for the future

If you recall the predictions for 2023, everyone was ga-ga about the metaverse and non-fungible tokens (NFTs). But I wonder if anyone would dare to even mention these in this year's predictions—not with so many crypto platforms going bankrupt, and the burgeoning grievances against celebrities like Cristiano Ronaldo, Justin Bieber, and Paris Hilton for promoting NFTs that are now worthless. Some companies like Binance are even facing very serious lawsuits for violating anti-money-laundering and sanctions rules, and for failing to block transactions sending funds to terrorist groups.

On the other hand, the 2023 predictions did talk about artificial intelligence (AI), albeit as just another trend. We could catch phrases like ubiquitous AI, AI everywhere, and adaptive AI, littered across the reports, but none prepared us for generative AI, the tech that stole 2023! We might as well dedicate the year that went by to generative AI, and perhaps the coming year too—because it is dominating everyone's agenda—from the tech makers and users to the hoi-polloi and the governments too.

And so it is, a prediction is a prediction, and must be taken with a pinch of
