

We can also license this technology to other OEMs as we are a technology company. We are also considering offering the system as a service,” Chanan says.

“Our next strategy is to assist businesses impacted by outdoor pollution. We are in advanced discussions with private entities in Delhi-NCR with outdoor public

places, such as restaurants, open shopping plazas, parking lots, and even airports,” adds Chanan.

In the future, the startup aims to expand to other states experiencing high air pollution levels. It has signed an MoU with the UP government to establish another Centre of Excellence at Kanpur in Uttar Pradesh.

3 PREDICTIVE CROP MAINTENANCE FOR EVERY FYLLO

Agri-tech startup Fyllo is successfully addressing challenges faced by farmers through the deployment of IoT devices collecting real-time farm data

The agri-tech market is flooded with IoT devices offering real-time data analytics to enhance crop yield and quality. Still, Bengaluru-based startup Fyllo has achieved a remarkable feat by onboarding more than 7000 farmers and deploying 6000 devices across 13 states in India for 22 crops.

Fyllo, meaning leaf in Greek, was founded in 2019 by two engineers, Sudhanshu Rai and Sumit Sheoran, who aspired to be entrepreneurs in a business they thoroughly understood, taking them back to their agricultural roots.

“By analysing approximately eight million queries through Kisan Centres across India, we found that farmers consistently sought advice on various aspects, from crop choices to fertiliser application and weather conditions. A significant number of queries came from grape farmers in Nashik, Maharashtra. This became our starting point, and after presenting our solution to farmers and receiving positive feedback, we officially began in April 2019,” Rai says.

The duo developed two precision

Nero installation

farming IoT-enabled devices to generate crop-specific advice for farmers: Nero and Kairo. The two devices can be installed in the farms to provide farmers with access to real-time farm data, insights, and analytics through a mobile application. Kairo has eleven sensors that collect data on rainfall, wind, temperature, and more, sending real-time information every 20 minutes. It has a solar panel retrofitted for supplying energy.

“Initially, we bought the panel for ₹1000, but now, due to bulk orders, we are getting them for ₹700-₹800,” says Sheoran.
