

on the AMD Versal Premium series. Ideal for next-gen network and cloud deployments, this SoM sup-

ports data centres, 5G networks, and communication test equipment. Available evaluation kits

aim to transform network and cloud tech. Key features include dual ARM Cortex-A72 @1.7GHz and Cortex-R5F @800MHz processors, 4GB LPDDR4 RAM, 256MB QSPI Flash, 16GB eMMC Flash, and 4Kbit EEPROM. It supports up to 112Gbps transceivers, multi-hundred-gigabit Ethernet, PCIe Gen5, and has 192 user-configurable I/Os. Compatibility extends to chipsets VP1552, VP1502, VP1402, VP1202, and VP1102.

Affordable low-power digital radio solution

CML Micro has launched the DRM1000 module, a cost-effective, low-power digital radio mondiale (DRM) broadcast receiver for consumer radio manufacturers. Developed with Cambridge Consultants, part of

Capgemini Invent, the DRM1000 boasts the smallest, most efficient design, consuming 80% less power than current models. Key

features include support for LF/MF/HF and VHF frequencies, emergency warning functionality, dual-mode DRM capability, and no additional fees for software licenses. It is pre-certified to the EU Radio Equipment Directive and measures 42mm x 25.4mm x 5mm. Available globally through distributors like Mouser and DigiKey, the DRM1000 includes an evaluation kit, the DE9180, for \$199. Enhancements, including wireless connectivity, are planned for 2024.

MANUFACTURING EQUIPMENT

AI-driven servo systems

Panasonic Life Solutions India's Industrial Devices Division (INDD) introduces the industry's first commercialised AI-equipped servo system, the MINAS A7 servo system, along

with the MINAS CZ1 Global and MINAS A6SC series servo mo-

tors for Indian OEMs. These advanced servo systems enhance manufacturing output through improved motion performance, control, and efficiency. The AI-driven system enables precision tuning, reducing operational times by up to 90%. With a speed response frequency of 4.0kHz and 27-bit encoder resolution, they set new benchmarks in precision. Compact and robust, they are ideal for limited spaces and various industrial applications, offering significant energy efficiency and cost savings.

TEST & MEASUREMENT

Clamp-on leakage current tester

Meco Instruments Pvt Ltd has launched the MECO clamp-on earth/ground resistance & leakage current tester (Model: 4680SL/4680 SLC). This

device features an elongated jaw for flat and round earthing strips, eliminating the need for ground and auxiliary rods, thus reducing setup time and avoiding operational shutdowns. It includes a resistance verification plate

for accurate calibration. The tester measures ground resistance from 0.01 to 500 ohms and supports earthing strips up to 55mm wide and round conductors up to 20mm. The 4680SLC

model measures leakage current from 0.5mA to 20.00A. Features include data storage, noise signal detection, auto-ranging, and auto power-off.

Affordable high performance waveform generators

Uni-Trend Technology has launched the UTG2000X Series, offering extensive features at cost-effective prices. With arbitrary waveform lengths from 8Kpts to 64Mpts, the series ensures

low jitter waveform output and includes 200 built-in

arbitrary waveforms. Equipped with a 7-bit frequency counter and 10 basic waveforms like sine, square, pulse, and noise, it suits diverse testing needs. Key specifications are a 10.9cm (4.3-inch) TFT LCD touch screen, 60MHz to 120MHz availability, dual channels, 625MSa/sec sampling rate, and 16-bit resolution. It supports various modulation outputs and connectivity options like USB and LAN, making it ideal for engineers in embedded systems, IoT, industrial control, and academia.

Flying probe PCB test system

The GRS550 flying probe test system by Polar Instruments GmbH improves upon its predecessor, the GRS500, renowned for its affordability and user-friendliness. Featuring advanced drive technology, the GRS550 enhances test

speeds and positioning accuracy. Ideal for prototype development, new product introductions, and small-batch produc-

tion, it excels where adapter-based testing is uneconomical. Utilising nodal impedance analysis and high-resolution imaging, it compares
