

disruptions, market trends to social media buzz and breaking news, holds the potential to propel a business forward. Within enterprises, data streams in constantly through emails, instant messages, data from ERP and control systems, departmental reports, yet a staggering 95% of it barely sees the light of day in terms of its full potential use. This reality begs the question of how we can harness this vast sea of information to our advantage.

Despite the goldmine of data at our fingertips, most organisations are still stuck in the past, relying on outdated methods. It is a familiar scene where we find ourselves dedicating a significant chunk of our workweek, up to 25%, just to sift through information, effectively losing a whole day each week to data scavenging. And when decision time comes, too often, we rely on gut feelings or decades of experience rather than leveraging the rich insights our data could provide, signalling a massive untapped opportunity.

Now consider the task of content creation, from presentations to sales pitches or customer communications, traditionally done in isolation. This is where we see a chance for transformative change. By welcoming new technologies into our workflow, we are looking at unlocking a potential productivity increase of 30 to 40%. This isn't just an incremental improvement; it is a leap towards a new way of working.

The emergence of AI and generative models like ChatGPT shines a light on the power of technology to revolutionise our workplaces. Picture a tool capable of condensing a 50-page document into a concise, insightful summary of 5 to 6 pages. This represents not just a significant saving of time but a complete overhaul of how we approach our work, allowing us to achieve more with less and opening doors to levels of productivity previously only imagined.

AI revolution in corporate workflows

The dawn of AI integration into corporate workflows is not just imminent; it is already unfolding. Major players in technology and BFSI sectors are leading the charge, leveraging AI tools to elevate their operations and customer engagements to new heights.

- **Widespread AI piloting.** Tech giants and BFSI leaders are actively testing AI capabilities, signalling a shift towards more intelligent, data-driven business processes.
- **Personalised content creation.** AI's role in customising communication, from emails to sales pitches, empowers teams to deliver tailored messages that significantly enhance customer engagement.
- **Operational efficiency.** Organisations are hosting workshops to familiarise all levels of staff with AI's potential, focusing on streamlining content creation and data analysis for improved productivity.
- **Democratisation of AI.** The once abstract concept of AI is now becoming more accessible and practical, with real-world applications becoming a common tool across various corporate functions.

As AI moves from the fringes to the core of corporate strategies, its impact is undeniable. Within the next couple of years, AI's integration into business operations is expected to grow exponentially, marking a new era of efficiency and innovation. This shift towards AI is not just about adopting new technologies; it is about reimagining the way we work and the possibilities that lie ahead.

AI impact on industries and jobs

One of the most talked-about applications of computer vision is its use in autonomous vehicles and drones. However, I want to share an intriguing insight from our own experience that goes beyond these familiar uses. In our manufacturing setup, further to the trials already done, we are implementing video analytics to monitor sensitive activities around the perimeters of our factory and within it. This technology alerts us if someone enters restricted areas, such as the R&D unit or specific production zones, where access should be limited. Previously, maintaining such security required extensive manpower, but now, artificial intelligence enables us to achieve this more effectively and efficiently.

The potential of AI extends beyond security to include natural language processing (NLP), audio, and text processing, uncovering vast opportunities across the entire supply chain. An increasingly important task for companies is monitoring social media for mentions of their products or brand, enabling them

to respond promptly and shape the narrative. This capability underscores the importance of integrating these technologies into our operations sooner rather than later.

Reflecting on the technological advancements from January 2021, when OpenAI launched DALL·E, to the continuous updates and versions leading to significant investments and launches by giants like Microsoft and Google, we see a pattern. These developments suggest a future where new age technology and human intelligence coexist harmoniously, augmenting human capabilities.

However, embracing this future requires us to adopt an exploratory mindset. We have reached a point where, instead of merely utilising machines, we are assisting them—a shift evident in practices like prompt engineering. This technique involves crafting prompts to guide AI tools like large language models (LLMs) towards desired outcomes, marking a significant evolution in our interaction with technology.

Historically, technology has facilitated mass production in various sectors, from automotive manufacturing to electronics. Now, we are
