

of the global business world, this figure is comparatively modest. A year ago, we didn't have a dedicated sales or marketing team actively participating in trade shows or employing other such strategies.

Our sales primarily stem from the products listed on our website and on EFY, optimised through SEO. Our partnership with DigiKey started a year back and we have generated around \$100,000+ in business within this period, solely from DigiKey.

How much does India contribute in your overall revenue?

India currently contributes up to 20% of our overall revenue. While we had not focused intensively on the Indian market previously, we are now making strides in this direction. We have recently onboarded a few industrial automation customers from Mumbai and Thane, who use one of our FPGA boards for smart grid applications in city-to-city industrial electrical transmission lines, capable of transmitting up to 1000 to 2000 megawatts. The response time of our system during a line cut is designed to be within 33 milliseconds. The FPGA board, with its low latency and ARM processor, allows customers to implement their FPGA logic and mathematical calculations for managing the power grid. This technology is used to promptly shut down the affected substation or node station, while maintaining HSR/PRP connectivity—a redundancy protocol with RJ45 1G or 100 Mbps connections—to ensure uninterrupted service even if one link fails.

How much of the revenue comes from your products vs ODM as a broad percentage?

Around 80% of our revenue comes from our branded products, while the remaining 20% comes from our original design manufacturing (ODM) services. In the

case of our ODM services, we offer customisation based on our clients' specific requirements. For example, when we work with a client like AMD, we develop certain boards for them, specifically their evaluation kits, system-on-modules.

Do you expect more growth from the EMS/ODM sector, or will you continue with an 80/20 approach between products and EMS?

Currently, we are maintaining an 80/20 balance. This ratio reflects our current operational focus, as we work in a single shift. If we decide to acquire more EMS customers, it will require us to expand our labour capacity. While we might consider this expansion in the future, it is not on our immediate agenda.

Where is your majority customer base?

The majority of our customer base is primarily located in the United States and the United Kingdom. Our first customer was from the US.

Who are your end-customers?

Our typical customers are system integrators and embedded system developers who design and build complete systems, not circuit design engineers. These customers usually order our products in varying quantities, ranging from a few hundred to a few thousand units.

For example, in the case of our system-on-module products, one particular model that is highly sought-after for smart grid applications can see requirements of up to 5000 pieces from a single customer. This indicates that once a customer has integrated our board into their system, every system they sell includes our board. We once had an Indian customer who developed a complete rack system for smart city applications using two of our boards for each unit. This customer is also exporting to end customers located in places such as Qatar and Dubai.

What is the profile of the customers whom you help in building a PoC?

The typical profile of our customers usually begins with engineers and test engineers who initially interact with us during the early stages of a project, particularly for proof of concept (PoC) development. As the project matures, our interactions often escalate to higher levels within the customer's organisation. This includes division heads and product marketing personnel who then become the primary points of contact. For instance, in the case of one of our customers, a 50-year-old company, our direct communication eventually reached the level of the Chief Technology Officer (CTO). Although the initial discussions and project explorations typically start with members of the R&D team.

What are the products under your own brand and who are the target customers for them?

Our products, under our own brand, are categorised into three major business verticals. The first category is data acquisition modules, which include GPO (general purpose output) and relay modules. These modules are equipped with industry-leading interfaces such as Modbus, USB, Ethernet, power over Ethernet, Wi-Fi, and Bluetooth. These interfaces enable users to control, configure, and monitor the relay modules. This range of products primarily caters to the industrial IoT (Internet of Things) and industrial automation sectors. They are also applicable for test jigs in manufacturing settings. An example of our product usage is by companies like Tesla, where our modules are used for factory automation purposes within their manufacturing plants, rather than in their cars.

Another significant vertical of our product range includes FPGA (field-programmable gate array) modules and system-on-module
