

we provide the basic CE and ROHS certifications for our products.

Do you provide any kind of presale samples?

For our data acquisition models, we require customers to purchase samples, as these products can range in price from a few hundred pounds to even a thousand pounds. However, if we identify significant potential in a collaboration or project, we are open to offering special discounts to these customers.

Are there any plans for an IPO?

Currently, we do not have immediate plans to go for an Initial Public Offering (IPO). Maybe in the future, but not any time soon. We might consider it in around 4 to 5 years.

What is Numato's take on RISC-V technology?

There are several advantages and drawbacks. The advantages include lower chipset prices compared to ARM processors. With ARM, there is an indirect licence fee, but RISC-V does not require a royalty fee. The drawbacks are that ARM is a well-established architecture globally, while RISC-V is still gaining traction.

There are fewer professionals in Numato experienced with RISC-V, and there is limited availability of sample codes and resources. Regarding RISC-V processors, we have one from Microchip PolarFire. It's a quad-core RISC-V processor with an FPGA logic cell. Currently, we're working with several drone customers to port Microchip's FPGA IP code for stepper and drone motor control, as well as object detection and surveillance. These IPs have been proven in one of their evaluation kits.

What is your area of focus for the future?

Our future focus will primarily be on building expertise in the FPGA (field-programmable gate array) domain and expanding our range

of FPGA systems. We are looking to integrate more system-on-chip (SoC) FPGAs into our product line. As of now, we have four system-on-module products and a few evaluation kits centred around Xilinx 7 series FPGAs.

Which segment do you expect your next bench of growth from?

Currently, we are expecting more growth in the Numato Lab segment, focusing on our products. Although, we are also planning to gradually increase our business with Numato Circuits. Currently, about 20% of our business revenue comes from this segment, operating with one line. We are planning to add another production line. Considering the operational costs and other factors, our goal is to scale up this segment to account for 35 to 40% of our business. To achieve this, we are setting up a dedicated sales team that will actively seek and engage with export customers for our EMS services.

Could you tell us something about the founders of the company?

The company has three directors—one is responsible for all operational aspects, another key person sits in the US, and the third one serves as our CTO. One of the main reasons we have a strong customer base in the US and UK is due to our CTO's efforts in the US. For instance, Google was one of our notable customers. We designed a custom FPGA board for them using crowd-supply funding. This was around 2013-14, a time when there weren't as many options for integrated audio-video systems in conference rooms as there are today with tools like Microsoft Teams or WebEx. We created an FPGA board capable of handling six camera inputs and various other inputs, offering overlay adjustments and more. Google purchased multiple units of this hardware for their offices. **EFY**

MECO
SINCE 1962

+60 YEARS
ONE MISSION

JAW 65 mm

4680BCL

CLAMP-ON EARTH / GROUND RESISTANCE AND LEAKAGE CURRENT TESTER

- ✓ Non-Contact Ground Resistance Measurement
- ✓ 4 Digit 9999 Counts LCD Backlight Display
- ✓ No Auxiliary Electrodes Needed
- ✓ Ground Resistance 0.010 to 1000 Ohm
- ✓ Leakage Current 0.5mA to 30A AC
- ✓ Data Storage Memory
- ✓ Data Hold, Noise Signal, APO
- ✓ Earthing Strip Upto 65mm
- ✓ Round Conductor upto 25mm Dia.
