## 1 IP67 CHARGERS AT THE COST OF IP20 CHARGERS

Founded in 2018, eCharge Mobility Pvt Ltd is an EV startup that claims to provide the most efficient chargers

1200W IP67 Off-Board charger

1800W IP67 On-Board charger

eCharge Mobility initially focused on charging infrastructure but later expanded its scope to design, develop, and manufacture EV components. Since it started in New Delhi, it got registered there. But later it shifted all its business operations, backend activities, and manufacturing to Bengaluru. “The city (B’luru) offers the perfect environment for innovation and growth, providing access to the right talent, skills, and like-minded individuals needed to elevate our ideas to new heights,” explains Ashish Kumar, CEO of eCharge Mobility.

Ashish Kumar shares, “We can sell our IP67 chargers at the cost of IP20 chargers, giving us a competitive edge in expanding our market reach to various OEMs and customers in India and internationally.”

The startup serves three categories of customers. The primary segment is OEMs of EVs who manufacture two-wheelers, three-wheelers (L3 & L5), or cargo vehicles—for whom they provide chargers, onboard chargers, and DC-

DC converters. The second category comprises battery OEMs who integrate their chargers with their packs for EV manufacturers. Third, they cater to individuals or companies looking to become energy or charge point operators.

“When we started our journey, we aimed to solve three main challenges: cost, quality, and timelines,” highlights Ashish. He shares that they have created a niche by addressing these challenges and offering technological advantages, such as onboard and IP67 chargers known for their quality and reliability. “Our chargers are 93-94% efficient,” adds Ashish.

Like most players in this segment, they too rely on China for critical components like semiconductors, which comprise 5% to 7% of the total Bill of Material (BoM).

Ashish’s team has about a dozen individuals dedicated to R&D and problem-solving. “Given our small organisation, the engineers often take on multiple roles. In total, we have 16 employees in our organisation. However, we cannot afford to expand our team due to financial constraints, which is why we are seeking funding. We handle everything in-house except the SMT (surface mount technology) part, as we lack the necessary infrastructure for it,” explains Ashish.
