

The startup generates revenue through manufacturing and selling products. They recently started a vertical that includes training and capacity-building and revenue from SaaS software. Their training is on basic technical knowledge and awareness about the EV ecosystem, products, markets, stakeholders, and companies. This online training is conducted weekly at a nominal fee.

Ashish shares that the business has consistently grown over the past three years, slightly declining this year due to industry corrections. To counter this, they have increased their focus on exports, which now comprise 30% of their business.

“Despite lower sales, year-

on-year growth has been almost 100%. We aim to see more Indian companies increase their manufacturing capacity to reduce reliance on imports, which accounts for 70 to 80% of their product sourcing,” concludes Ashish. This means more TAM (total addressable market) for eCharge Mobility.

The startup aims to raise \$2 million in funds immediately. It anticipates needing \$30 to \$50 million over the next two to three years to serve tier 1 OEMs in India and expand its product development capabilities. And with that funding, the startup plans to expand its in-house manufacturing from 1500 to 3000 monthly units within a year.

2 SETTING UP PLANT FOR MOTORS THAT DELIVER 97% EFFICIENCY

What can four students competing in Formula Student race teams achieve? Why would these students, originally focused on developing an electric two-wheeler brand, pivot into the more challenging B2B business of motors? Attron's Co-founder, Udhay Singh explained it all to Mukul from Electronics For You

Four college students, with experience in Formula Racing and having collaborated with engineers from global gasoline and electric car racing teams, embarked on a mission to build an electric motorcycle for India. Their requirements from electric vehicle component makers were not simple, given their exposure to renowned engineers. “Either import from China, or spend a lot with Indian component manufacturers, to develop motors and motor controllers that we wanted; these were the only two choices left for us,” Udhay Singh says.

The four co-founders took it upon themselves to build motors and motor controllers for the electric motorcycle they were developing
