Automotive Auxiliary Drive Systems-Equipped with Diotec's DI110N04PQ-AQ MOSFET

When it comes to developing more efficient solutions, automotive auxiliary drive applications are undoubtedly a top priority. Power density, thermal performance, and space have been identified as critical areas for improvement. Diotec's 40 V low RDS (on) MOSFETs in the QFN5x6 package are well suited for a wide range of thermally demanding systems operating in the 30 to 250 W range, including water, oil, and fuel pumps.

AEC-Q101 qualified

For automotive auxiliary drive systems

Auxiliary drive systems continuously demand components with high performance and reliability levels. QFN5x6 MOSFETs provide the ideal solution to these automotive design challenges. They offer ultimate electrical performance due to low package resistance and inductance. The DI110N04PQ-AQ from Diotec Semiconductor is a 100 A / 40 V N-channel MOSFET, ready to deliver the highest performance. The very low on-state resistance of typically 1.9 mΩ helps to reduce heat generation. Its ultra-fast switching times keep power losses low even at high-frequency switching drive inverters.
