

Tiny development board for wearable projects

The IndusBoard Coin, launched by IndusBoard (an EFY initiative), is a development board designed and developed in India. This tiny board enables miniature and wearable project designs. It integrates features such as the ESP32S2 chip, over 30 GPIO pins with PWM, analogue, and multiple I2C serial and SPI ports, 4MB flash, an additional 2MB PSRAM in the chip package, a 2ULP RISC-V co-processor, chip temperature sensor, and a processor speed of 240MHz. Setting it apart from similar boards, the IndusBoard Coin includes onboard sensors like a 3-axis accelerometer, 3-axis magnetometer, and a temperature sensor for separate environment and chip temperature readings, making it ideal for wearable design applications.

video streaming, virtual reality, and augmented reality.

Infrared industrial thermometer

MECO Industrial has launched the IRT600TC infrared thermometer offering precise surface temperature readings from a distance. It meets the diverse requirements of professionals in different fields. Its simplicity, portability, and ease of use makes it useful for diagnosing temperature-related problems efficiently. Capable of reading temperatures from -50°C to

600°C (-58°F to 1112°F) with a 12:1 distance spot ratio and adjustable emissivity from 0.1 to 1.0, it caters to various applications. The thermometer allows easy switching between Celsius and Fahrenheit, features a laser pointer for accurate targeting, an auto power-off function for battery conservation, a low-battery indicator, and a colour backlight display for clear readings under any lighting conditions.

Over-temp detector for EV batteries

Littelfuse has introduced TTape, an over-temperature detection platform designed to enhance lithium-ion battery system management. This

platform excels in managing premature cell aging and mitigating thermal runaway risks in electric

vehicles, hybrid models, commercial transportation, and energy storage systems. Key features include management of early cell aging, prolonged battery lifespan through early temperature management, and comprehensive monitoring across multiple cells for quick alerts to the battery management system. With an ultra-fast response time of under one second and easy integration without calibration needs, TTape represents a significant advancement in battery safety and efficiency.

MISCELLANEOUS

Gen 5 SSD storage solution

Team Group Inc. has introduced the T-FORCE GE PRO PCIe 5.0 SSD, a cutting-edge storage solution leveraging PCIe Gen 5 x4 and NVMe 2.0. Designed for gamers and performance-

driven users, it boasts an InnoGrit's 12nm IG5666

controller, energy-efficient multi-core features, high-performance 2400MT/s NAND flash supporting DRAM and SLC caching, and impressive read speeds up to 14,000MB/s. Smart thermal regulation technology adjusts performance based on temperature, ensuring longevity and reliability, complemented by 4K LDPC technology for data transfer accuracy.

Antenna for smart meter connectivity

The Antenna Company has launched the AC97002 multi-band cellular antenna, tailored for indoor smart meter gateways and IoT. Offering reliable coverage across 698-960MHz to 1700-2690MHz, it boasts up to 75%

efficiency in sub-GHz bands with compact dimensions of 45mm x 170mm x 35mm.

Its flexible in-cabinet installation suits diverse IoT environments. Featuring a detachable cable with Fakra D connector, it ensures quick setup with intelligent meter gateways. With omnidirectional radiation, it mounts horizontally or vertically on metal or non-conductive surfaces, compliant with ROHS and REACH standards. Addressing connectivity needs, it aids grid operators in smart metering infrastructure deployment.

Digital twin multiphysics platform

Cadence Design Systems, Inc. has launched the Cadence Millennium Enterprise Multiphysics Platform, an

advancement in multiphysics system design and analysis. Featuring a digital twin solution, this platform changes

computational fluid dynamics (CFD) simulations. Tailored for sectors like automotive, aerospace, defence, energy, and turbomachinery, it optimises mechanical system design for performance and eco-friendliness. With features like CFD solvers, it reduces simulation times from weeks to hours while offering energy efficiency. Leveraging Cadence Fidelity CFD solvers and generative AI, it ensures accuracy and enables rapid creation of digital twin visualisations.
