

developers to concentrate on application development and accelerate time-to-market. This strategy not only eases technology adoption but also improves lifecycle management of applications, setting a new standard in 'application-readiness' for embedded systems.

AI-native IoT processors and development kit

Synaptics Incorporated has introduced the Astra platform, which includes the SL-Series of AI-native IoT processors and the Astra Machina Foundation Series development kit. This platform

caters to the increasing demand for AI in IoT, providing a scalable and flexible solution. The SL-Series processors are tailored for edge IoT applications across consumer, enterprise, and industrial sectors, enhancing data privacy, reducing latency, and delivering high performance with low power usage. It supports various applications like home automation and smart cities, featuring hardware accelerators for edge inferencing and multimedia processing.

MANUFACTURING EQUIPMENT

PCB-assembly soldering machines

Nordson Electronics Solutions has unveiled the Synchro 3, expanding its Synchro series of selective soldering machines aimed at enhancing high-volume PCB assembly. The series, which includes Synchro 3, 5, and 5 XL, employs synchronous motion technology to cut conveyance times and

reduce equipment space by up to 60%, boosting throughput by 20-40%. These systems offer process control enhancements that are optimal for manufacturers focused on improving solder joint quality and production efficiency.

TEST & MEASUREMENT

Direct compliance-testing power analysers

Rohde & Schwarz has launched a new line of power analysers, the R&S NPA series, designed for detailed electrical measurements such as voltage, current, and power, and to evaluate harmonic distortion in DC and AC sources. They feature a 16-bit A/D converter, up to 500 ksamples/s sampling rates, multi-display measurements, peak value tracking, and LAN and USB for remote control, with the NPA701 uniquely facilitating direct compliance testing without an extra PC.

Tester for satellite/NTN devices

Anritsu Corporation has introduced a protocol test solution for non-terrestrial network (NTN) devices utilising geostationary earth orbit (GEO) satellites, integrated into the signalling tester MD8430A. This update supports NB-IoT as outlined in 3GPP Release 17, catering to NTN device manufacturers, satellite communication providers, and telecom companies. The enhanced MD8430A features software options for connectivity and delay compensation testing critical for the 36,000km GEO satellite link. The system facilitates LTE-advanced tests, dual connectivity, and up to 2Gbps throughput, making it essential for stages from R&D to con-

formance testing, providing a thorough set of tools for device development and verification.

High-density PXI and PXIe multiplexer modules

Pickering Interfaces has launched a new series of high-density PXI and PXIe multiplexer modules, specifically engineered for high-voltage applications. These modules are

designed with advanced ruthenium relays for enhanced

hot switching up to 1kV, incorporating miniature, high-performance reed relays for reliability and precision. Features include RFI suppression for operational longevity and hardware interlocks for safety, backed by a three-year warranty and comprehensive software support.

MISCELLANEOUS

BIOS updates for Intel motherboards

ASUS has released BIOS updates for its Intel 700 and 600 series motherboards, significantly enhancing their capabilities by supporting up to 256GB

of DDR5 memory. These motherboards supported less memory, but now, models with

four DIMM slots can handle up to 256GB, while those with two slots can accommodate up to 128GB. This upgrade is crucial for users involved in multitasking, video editing, 3D rendering, and extensive data analysis, as it allows for smoother operation of multiple applications and more efficient handling of large datasets.
