

India's World Automotive Leadership RELIES ON SEMICONDUCTOR

As India accelerates towards automotive excellence, semiconductor innovation fuels the journey, promising a future where Indian-made chips drive the wheels of progress worldwide

CHETAN ARVIND PATIL, Senior Product Engineer at NXP USA Inc.

According to the Ministry of Heavy Industries statistics, India's automotive sector ranks fourth globally in production. By the end of 2023, India emerged as the world's third-largest car market based on sales, and the valuation of India's automobile industry positioned the country fourth worldwide. Overall, the sector contributes 7.1% to India's GDP.

These statistics highlight critical aspects of India's automotive industry and its domestic and international significance. So much so that in the next couple of years, India has an ambitious plan to double its automotive industry growth and become a world leader in automotive within a decade.

The key to this growth relies on semi-

conductor components, which, over the past decade, have become the backbone of all modern vehicles. These tiny silicon chips enable various features, ranging from safety, communication, entertainment, and efficiency. Automotive customers in India and globally realise how important safety features are, which are only possible if smart silicon chips are used.

Thus, the semiconductor industry will inevitably drive automotive growth in India and become more crucial for government initiatives like the Faster Adoption and Manufacturing of Hybrid and Electric Vehicles (FAME) scheme, which encourages the adoption of eco-friendly vehicles through subsidies and incentives. The
