

gos, says, “Most businesses in need of such a solution will experience it through a lease partner or fleet operator. This compact logistics vehicle (CLV) is versatile, suitable for numerous applications, including delivery vehicles, roadside assistance, firefighting, and emergency ambulances.”

In developing the F9, the startup has filed over 100 patents in vari-

ous countries, investing more than ₹15 million in the process. Approximately 50 of these patents have been granted, and the founders are optimistic about securing the rest in the coming months.

“Patents filed cover technology, structural elements, and utility. We’ve created a comprehensive network of patents, ensuring it will take competitors several years to develop anything

similar,” a confident Das states.

Das also notes that many traditional organisations hesitate to take product risks due to their structural limitations. “In fact, several legacy companies are now retracting their earlier electric vehicle initiatives. For them to adopt this technology, it could take up to four years of research,” he adds.

The startup reveals that its research indicates one in every 25 people in India uses their two-wheeler for commercial purposes. There are around 230 million registered two-wheelers in India. Though they have already localised over 75% of the product, the startup has so far been funded solely by family and friends.

“We are open to raising funds as long as it doesn’t restrict our ability to enhance the product further. We will onboard partners who can accelerate our manufacturing process,” Praveen adds.

The logistics sector has become the biggest adopter of electric two- and three-wheelers in India. The startup is also keen to explore markets in Africa, Europe, and other international regions for the deployment of the Qargos F9.

3 upliance.ai’s ChefGPT IS HERE TO UP YOUR CULINARY SKILLS

upliance.ai is on a mission to make cooking easy for everyone by leveraging large language models for recipe generation via its Cooking Assistant

The allure of Korean Bibimbaps featured on Netflix’s K-Dramas and Instagram food reels has inspired many to revolutionise their kitchens in pursuit of restaurant-quality home-cooked meals. After spending hours scrolling for the perfect recipe and ensuring the ingredients are in the correct

proportion, the reality of a sink full of dishes often dampens these ambitious plans.

IIT Bombay alumni, Mahek Mody and Mohit Sharma, have developed a solution to alleviate these woes with upliance.ai’s Cooking Assistant, which merges technology with the culinary arts,

enhancing the cooking experience through artificial intelligence. Designed, marketed, and sold by the startup for ₹29,999, specifically for Indian kitchens, the Smart Cooking Jar features IP54 water and masala resistance, safety sensors, and automatic heat cutoff mechanisms for functions like automated cutting,
