

The code for temperature measurement using LM35 is described here. A library for the LCD unit is included and then data and control pins for the LCD and temperature sensor are defined. After obtaining an analogue value at the analogue pin, that value is read using the

Construction and testing

Bonus. You can watch the video of the tutorial of this DIY project at <https://www.electronicsforu.com/videos-slideshows/live-diy-make-digital-thermometer> 

Fig. 3: Snippet of the source code

In this thermometer, the Arduino is used to control the entire system. Arduino is an open source hardware platform for development purposes that runs on ATmega controller.
