

electronics manufacturing. The system offers easy setup, IPC-610 inspection algorithms, AI options, and Smart

Factory compliance, supporting IPC-CFX and IPC-HERMES-9852 standards. Equipped

with a 12MP high-speed camera, it allows configurable resolutions (10µm, 12µm, 15µm) and features Quad Digital Fringe projectors for accurate 3D inspection up to 40mm height. Its multi-step function enables inspection of both tall and short components in the same cycle.

Real-time X-ray inspection system

The Glenbrook RTX series offers modular, real-time X-ray inspection systems optimised for flexible production, including PCB manufacturing. Designed for long-term reliability,

these systems are easily upgradeable with customisable configurations. The RTX-113HV Micro-

Tech model delivers high-resolution imaging for inspecting PCBs, BGAs, LEDs, sensors, and medical devices. It features an 80kV, 5-micron focal spot X-ray tube, supporting dense components like BGAs with heat sinks. With a 38.1cm x 38.1cm motorised X-Y positioner, it scans large PCBs up to 45.72cm x 60.96cm. The system provides up to 100lp/mm resolution, 225x optical magnification, and integrates seamlessly into production lines for precise, efficient quality control.

TEST & MEASUREMENT

Oscilloscope

Keysight Technologies Inc. has introduced the InfiniiVision HD3 series oscilloscope, featuring a 14-bit ADC

for four times better signal resolution and half the noise of typical oscilloscopes. Designed with a custom ASIC and advanced memory, it helps engi-

neers identify signal issues efficiently. As modern designs grow complex, engineers need precise tools to

detect subtle signal flaws. The HD3 series excels with a low noise floor of 50 µVRMS and bandwidth options from 200MHz to 1GHz, enabling superior debugging. It supports fast updates at 1.3M waveforms/second, deep memory, and automation through fault hunter software.

AUTOMATION

Smart camera

Teledyne DALSA has launched the BOA 3 smart camera, advancing industrial automation and inspection with

AI-powered technology. Building on the success of previous models, it features sensor resolutions from 1.2MP to 12MP,

integrated or C-mount lens options, and onboard I/O. Designed for rugged environments, the modular system offers flexibility for complex machine vision tasks. The camera includes user-friendly software and iNspec no-code tools for tasks like barcode reading, defect detection, and AI-powered OCR. Astrocyte, Teledyne's AI training software, supports model creation for classification and object detection.

Wi-Fi temperature and humidity data logger

BrainChild Electronics has launched the XH12 Wi-Fi temperature and humidity data logger for monitoring

spaces like warehouses and labs. It tracks conditions in cold chain logistics and multi-point environments in real time. The logger works with

Wi-Fi networks, and boosters can extend coverage in weak signal areas. If the connection drops, it saves data and uploads it once Wi-Fi is restored, ensuring no data is lost. It has external sensors with 1m or 2m cables, useful for places like hospital storage, retail stores, and museums. The sensors stay inside cool areas, while the main unit stays outside to avoid heat interference.

MISCELLANEOUS

Digital microscope

Keyence's new VHX-X1 series digital microscope revolutionises microscopy with ultra-high-definition 4K imaging, SEM-like 3D visualisation,

and advanced automation. Suitable for industries requiring precise microscopy, it

offers seamless magnification from 5x to 6000x using telecentric HR lenses for sharp images across a wide depth of field. Its advanced optical shadow effect mode provides 3D-like surface detail comparable to SEM. A motorised turret enables easy magnification changes, while a 300mm stage allows larger sample observation. With automated settings and image stitching, it saves time on repetitive tasks, making it accessible to experts and novices alike for contamination analysis, metal inspection, and precise 3D measurements.
