

startup is scaling production and distribution to meet the growing demand, especially as they expand into consumer markets. Regarding the revenue, Subhendu says, “We recently began generating revenue and completed our first corporate order with Analog Devices through Macnica Cytech Pte Ltd. So far, we have sold about 500 to 600 units and are gaining traction, especially as we approach the busy second half of the year. We are seeing interest from companies wanting to give our ‘Made in India’ GaN chargers to their clients and staff. Additionally, we are expanding our direct-to-consumer sales via various

online e-commerce platforms.”

Looking forward, the startup is keen to expand manufacturing capabilities while exploring partnerships with semiconductor firms. They also

plan to engage channel partners, distributors, and academia to foster innovation and keep their chargers at the forefront of technology.

2 HARNESSING AI TECHNOLOGY FOR EFFICIENT PEST MANAGEMENT

AI-Genix, an agri-tech startup, is transforming pest management for farmers through advanced AI-enabled systems that precisely target harmful pests.

In an industry where pesticides and toxins degrade the quality of produce, AI-Genix is leading a shift in agriculture. Their cutting-edge products leverage AI-driven sound waves to pinpoint and eliminate pests, offering a chemical-free solution that safeguards crops.

Founded in 2019 by Shahnaz Shaikh (CEO) and Khalil Shaikh (CTO), this Mumbai-based startup is committed to sustainable farming, using technology to protect crops. With roots in farming themselves, the founders have firsthand insight into the challenges farmers face.

The core issue they tackle is crop damage from insects. Initially relying on insecticides, they shifted focus after several accidents involving toxins and farm workers. This led them to seek a safer, more sustainable alternative—one that protects not only crops but also humans, the environment, and ecosystems.

Their products integrate AI to

BraveHawk Monza

maximise impact by targeting and eliminating specific insect species using sound waves. This innovative approach boosts efficiency and promotes agricultural health by cutting down on chemical pesticide use.

Manufacturing and assembly take place at their Mumbai facility, ensuring tight control over quality and supply chain efficiency. AI-Genix employs a dual-channel distribution model: a retail network for wide consumer access, and direct engagements with corporate clients to deliver customised solutions for large-scale agricultural operations and businesses.

They have deployed more than 4600 systems in various parts of the world to date. In FY2024, they aim to deploy around one million units worldwide.

The startup offers three distinct series of products designed to enhance sustainable farming practices:

SmartRavager. This solar-powered, unidirectional insect communication system is designed for the management of over 1200 Genus Species of insects and pests. It effectively controls pest populations without harming crops or beneficial,
