

What services and products does AVPL provide?

At AVPL, we offer skill development training focusing on drone technology and agriculture. We also manufacture and sell drones. The company was founded in December 2016. Our uniqueness lies in our physical presence across 12 states, with centres in 70 locations, primarily in semi-urban and rural areas.

What is the purpose of this training programme?

We aim to create one village-level drone entrepreneur and one village-level agri-entrepreneur across India. Our vision goes beyond skill development training. We follow the National Skill Qualification Framework, providing level-wise training while incorporating entrepreneurship into the curriculum. Our primary focus is to create job opportunities for candidates upon completing the training and encourage them to become micro-entrepreneurs. Ultimately, our main vision is to develop village-level entrepreneurs.

What types of drone courses do you offer?

One of our courses is the Remote Pilot Certificate (RPC). In this five-day programme, students undergo training and receive a licence valid for ten years, allowing them to fly drones anywhere in India (Green Zone). In addition to the RPC, we have developed a seven-day Agriculture Spray Course. Students can fly drones after completing the RPC and obtaining their licence. However, agricultural drones used for spraying are significantly heavier, around 20 to 25kg, compared to the 2 to 3kg training drones. To address this, we have designed a comprehensive course where, after completing the RPC, students learn how to operate

agricultural drones for spraying. These are the two key courses related to pilot training that we offer. Also, we are the first organisation to execute the Kisan drone operator course, affiliated with the Agriculture Skill Council of India, and partner with Drone IT from Australia for dual certifications and drone cadets from the USA in drone training.

What are the requirements and structure of your five-day course?

We have four DGCA-approved bases, which are open for public viewing. The process is straightforward: it is a five-day course with two days dedicated to theory classes, one day for simulator training, and two days for practical flying. Our toll-free number connects directly to our supportive team. For eligibility, candidates who have completed at least the 10th or 12th-grade education standards are qualified to enrol in our programme.

Are your courses conducted online or offline?

All these courses are conducted offline. According to the National Skill Qualification Framework (NSQF) mandate, we cannot provide online training for Kisan drone operators. However, for the RPC certificate, the theory class is conducted online over two days, while the remaining three days are offline and dedicated to practical flying classes.

What qualifications are needed for micro-entrepreneurship and drone programmes?

The candidate should be 18 years old and should have passed the 10th grade. For micro-entrepreneurship and village-level entrepreneurship, our target audience includes students from diploma programmes, ITI, or 10th and

12th-standard graduates. These individuals should have some understanding of what they are getting into. However, when it comes to junior drone engineers and preparing candidates for the research departments of drone companies, our target audience requires higher qualifications, such as those pursuing a B.Tech degree.

Are your courses designed solely for agricultural use?

Our courses are designed for the entire industry, but our company's vision focuses on agricultural drones. Our end users are farmers, as the drones are intended for their use. However, our primary audience consists of individuals who will become service agents to deliver these drone services to farmers. We train these individuals because they have direct connections with farmers and their families and are familiar with village life. They can effectively communicate with and convince farmers about the benefits of using drones, including increased productivity and improved soil and individual health.

What are the costs and conditions for your drone training courses?

According to market standards, our drone pilot training course costs 35,000 rupees plus GST for a five-day programme. The cost of other classes varies based on their duration. Our drone assembly and service technician courses are often run under government-subsidised programmes, so candidates are not charged for these. For paid courses, the starting fee is 35,000 rupees plus GST. If a trainee purchases a drone from us, this fee is adjusted, and we provide the training at no additional charge. Therefore, when someone buys a drone, we ensure they are trained to operate it without extra cost. We also assist students with
