Smallest ever display controller

Texas Instruments (TI) has introduced the DLPC8445, a 9mm x 9mm display controller for 4K UHD projectors in compact size, low latency, and power

efficiency. This controller, the smallest in its class, supports 254cm (100-inch)

diagonal displays and integrates seamlessly with a digital micromirror device, a power-management IC, and an LED driver. Designed for both entertainment and professional use, it offers sub-millisecond latency, rivaling top gaming monitors. Variable refresh rate technology enhances gaming performance, while image-correction technology allows projection on various surfaces, ensuring a smooth experience.

AC/DC power converters

RECOM has expanded its range of AC/DC power converters by introducing the RACM15E-K series, which delivers up to 15W of output power for an

input range of 80-275V AC.

This new series is available in two versions:

an open frame (/OF) model and an IP20-enclosed (/PMAD), designed to fit into standard 1.5-module DIN rail slots. The converters operate within a temperature range of -40°C to +85°C, with derating starting from 50°C. They offer efficiency rates of up to 86% and

provide outputs ranging from 3.3V to 30V DC. The series is fully protected, certified for safety, and designed with eco-friendliness in mind. With a mean time between failures of over one million hours, these converters are ideal for industrial, medical, and household applications.

Affordable automotive MCU

The automotive industry is moving towards digital cockpits, replacing traditional buttons with advanced displays. These systems must offer high perfor-

mance and meet strict safety standards. This requires high-cost systems-on-chips (SoCs) with hypervi-

sors, making it impractical for low-end vehicles. Infineon Technologies AG, partnering with MediaTek, has introduced a cost-effective solution. It combines Infineon's TRAVEO CYT4DN MCU with an entry-level MediaTek Dimensity Auto SoC, lowering hardware and software costs. The MCU ensures ASIL-B safety compliance by monitoring the SoC, taking over if errors occur. Using Android OS, this solution reduces complexity and eliminates the need for costly software licenses.

High-speed IR emitting diode

Vishay Intertechnology, Inc has expanded its optoelectronics line with the TSHF5211, an 890nm high-speed IR emitting diode. Encased in a clear,

untinted, leaded plastic package, it ensures durability and easy integration.

It uses advanced surface emitter technology to offer enhanced performance,

with a VF temperature coefficient of -1.0mV/K, indicating stability and reliability. This makes

it a suitable high-intensity emitter for applications such as smoke detectors and industrial sensors, offering effective spectral matching with silicon photodetectors. RoHS-compliant and halogen-free samples and production quantities are available with a 20-week lead time for large orders.

Li-ion battery protection fuses

Littelfuse, Inc. has extended its ITV2718 series of surface-mountable Li-ion battery protectors. These fuses safeguard Li-ion battery packs from

overcurrent and overvoltage, even during fast charging. Suitable for consumer elec-

tronics like smartphones and tablets, the ITV2718 ensures fast compliance with UL and TUV certifications.

Environmentally friendly, it features halogen-free, RoHS-compliant components, simplifying automated PCB assembly.

Digital signal controllers

As embedded systems grow in complexity and performance demands rise, Microchip Technology's dsPIC33A Core family of digital signal controllers (DSCs) offers a robust
