walls with digital flowers that move or fall when touched, or an impressive waterfall that cascades down a wall and floods the space. Visitors can walk through digitised waterfalls, 'touch' luminescent birds, and wander through computer-generated forests and fields here.

The works here are not pre-recorded animations or looping images; they are created in real time. Each artwork evokes a sense of innocence and sincerity. Computer-generated butterflies lead visitors into what is essentially a giant playground equipped with a space-themed aerobatics area and a glowing neon jungle gym. All the projections react to touch, and visitors can experience local lizards squirming and flowers blossoming. Sensors that interact with

movement and projections of light are at the heart of this experience.

In the fourth section, Forest of Lamps, there are 1000 suspended, motion-sensored lanterns emitting low, dreamy hues onto floor-to-ceiling mirrors. The light and reflections expand the space into eternity, reminiscent of Yayoi Kusama's 'Infinity Mirror Rooms.' Whether this forest represents a timeless plane or is simply fodder for a Facebook post, the childlike wonder it evokes is undeniable. Surrounded by lanterns and their ever-changing colours, visitors are immersed in the atmosphere.

Future Park is designed for children. The park has facilities for kids to interact with the art through various games and activities. These include a digital aquarium filled with

digital fish designed by the kids themselves and a musical wall that plays sounds upon touch. The activities are designed to expand the imagination and teach scientific concepts.

The final experience is calmer, as guests in En Tea House sip cups of green tea while augmented reality technology makes digital flowers bloom inside their cups.

While TeamLab's digital art museum and similar experiences are generally safe and enjoyable, there are a few potential health hazards to be aware of. Prolonged exposure to bright lights and visual stimuli may cause eye strain or headaches in some individuals. Additionally, crowded spaces can increase the risk of accidental collisions or tripping. However, these risks can be minimised by taking
