

NEBULAE IN TERMS OF IoT ECO-SYSTEM

IoT is much more than a network that talks & exchange data. Generally speaking, it is an Eco-System & it's not just transforming connectivity among devices & objects but it is also allowing people to get remote access easily. The success of IoT depends on Standardization, Interoperability, Compatibility, Reliability, & Effective Operations. Nebulae comes with all these features that helps maintaining the below components of **Eco-System**.

Nodes/sensors: The main components that complete connectivity layer are nodes/sensors. Sensors collect the information & send it to Gateway where it is being processed. A NebuLink Node is a broad-level component that provides IPv6 internet connectivity for sensors with self-configuring, self-healing & self-sustaining network that enables quick network deployment & guaranteed message delivery.

Gateway: Gateway act as a bridge between sensors/devices & the cloud. Sensors/devices talk to Gateway & Gateway will pass information to the cloud. NebuLink Gateway is unique due to its advanced feature 'Hybrid network management' which allows any sensor node from different networks to communicate securely without cloud intervention.

Middleware: Middleware acts as a bridge between hardware & application. NebuLink Middleware with its super-rich features can collect, process, handle & store the data efficiently in real time. It is also responsible for making a tough decision that can easily break the deal.

Security: As IoT applications collect more & more data, often private data, allow access to various control functions over the internet; security becomes a major challenge. Nebulae provides highly secure communication & scalable network with 3-tier encryption using the AES-128 bit standard, TLS/SSL security & RSA & AES algorithm security standards.

Nebulae provides a number of critical advantages & a range of features that allows rapid IoT development & deployment. With Nebulae you can create your IoT applications up to 10 times faster than before.
