

SiC. A semiconductor with a Potential capacity of 119 billion kWh.

Eliminating electricity wasted as heat.

Electricity affects almost all parts of our lives. But did you know that some of the electricity supplied by power plants is lost as heat before it reaches us?

SiC power devices are expected to dramatically reduce this wasted electricity. Adopting SiC for all power conversion during power transmission will make it possible to effectively utilize at least 119 billion kWh worldwide* (equivalent to the annual output of 20 nuclear power plants). Superior device characteristics reduce loss by more than 50% compared with conventional products, enabling high efficiency power conversion.

Currently, introduction in photovoltaic power generation that is showing accelerated adoption at an early stage is quickly

progressing, and among power conditioners for solar power generation produced around the world in 2016, it is estimated that over 60% are utilizing SiC. And going forward SiC is expected to be employed in a wider range of fields.

ROHM has been working on SiC research and development for over 20 years. This technology was born from a desire to contribute to society by looking at the next generation and developing what was necessary. In the future ROHM will continue to develop solutions aimed at solving social problems through business activities.

*From the Agency for Natural Resources and Energy's 'White Paper on Energy 2017', which cites that the total electricity generated worldwide is 23.8 trillion kWh. Calculated as approx. 1% power conversion loss (as part of the transmission loss) and 50% improvement in efficiency when adopting SiC.

■ ROHM's SiC Power Device Lineup

Full-SiC Power Module
1200V
(80A / 120A / 300A /
400A / 600A)

SiC-MOSFET
1700V(3.7A~5.9A)
1200V(10A~95A)
650V(21A~118A)

SiC SBD
1200V(5A~40A)
650V(2A~40A)
