

3D PRINTING PENS FOR YOU AND YOUR KIDS

3D printing pens are a low-cost alternative to 3D printers that let you draw and create objects from your imagination

Deepshikha Shukla

Do you want your kid to learn by doing? Or do you want to do something creative and design things for your house? If yes, here is something for you and your kids both: 3D printing pen, which lets your drawing and crafts take shape in three dimensions.

By simply drawing, your children can create 3D figures in whatever shape they want—a cube, a circle, a cuboid or a cylinder. So they can actually touch and feel them.

There are lots of things you can design for use or for learning and education. For instance, your kids can build their own 3D printed toys using the pen. The pen can also be used for artistic and decorative work. You can design your own jewellery or a flower vase.

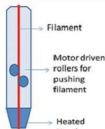

Using 3D printing pen is as simple as using a normal pen or pencil. You just need to insert the filament, turn on the pen and draw. 3D pens are held in the same way as any other pen, but are able to draw in the air and on the surface as well. As both the pen and the filament are made of plastic, these are safe to use.

How it works

When you connect power supply to your pen and switch it on, the plastic filament is heated and pushed out of the tip of the pen's nozzle. Heating converts it into molten form, which can be given any shape. After a few seconds, it cools down and takes the shape it is worked into. You can draw on almost any surface such as walls, furniture and plastic. Almost the same technology is used in glue gun, but 3D pens come in multiple colours.

How to use

Before you start printing, perform a few simple steps:

1. Connect power supply to your pen and turn it on.
 2. Select the filament (or colour) that you want to print with.
 3. Select the temperature setting as per the filament you are using. Wait a moment for the pen to heat up. Most models have an indicator light to tell you when these are hot enough.
 4. Insert the filament into the filament input port. If you have already used it, trim it to make it flat. This helps to prevent jamming. Once you set the filament, press Extrude button. You should feel the internal motor pulling the filament, which comes out in molten form.
 5. Select Fast setting and press Extrude button. You can adjust the speed based on the design you need to print.
