

ARTIFICIAL INTELLIGENCE

attributes. Learning rate, a mathematical measure, is a decreasing function of time as the process is very inefficient in the beginning when we are learning to do something new. The efficiency gets better with more practice.

How AI is helping to increase the business

AI has two main applications in fashion: One is styling and creating clothes and the other is helping fashion business houses predict current and future trends to create clothes that are in high demand and enable a highly personalised shopping experience for customers.

AI can help retailers to leverage massive amounts of unstructured data to improve and personalise the online shopping experience. At present, fashion brands and retailers are dependent on a limited amount of data to forecast the products to order and then the products to discount or replenish towards the end of the season. A wrong prediction results in revenue loss due to mark-downs, wastage and discounted selling of items. AI can help a retailer to align product stocks with demand, and also display products for maximum sales generation by analysing large amounts of data—for example, browsing and shopping history of customers.

Stylumia is an AI-powered tool that can interpret a huge amount of data collected from videos, e-commerce sites, social media, etc. Its users have reported 200-400 per cent jump in revenue growth and about 25 per cent reduction in inventory. Fashion leaders such as Vero Moda, W, Jack & Jones and Pepe Jeans regularly use Stylumia to predict consumers' likes and dislikes.

IBM's Watson is partnering with The North Face to offer guided shopping online. The AI system asks shoppers questions on factors such as gender, time of year and product details to deliver customised recommendations.

Marchesa, a high-end French label, has created a cognitive dress using AI tools. The dress changes colour according to the live comments made by clients on their social media accounts.

The fashion industry is increasingly embracing the latest developments in AI to increase e-commerce productivity, improve retail experience, and provide promotional campaigns and clothes themselves. India is also waking up to AI-enabled fashion. Designers Falguni and Shane Peacock have unveiled a collection in collaboration with IBM-Watson. Myntra has launched a popular line of machine-designed t-shirts, called Moda Rapido, which have been developed using in-house AI platform RAPID. Vue.ai by Mad Street Den, an AI company in Bengaluru, provides personalised style recommendation to shoppers.

Looking ahead

Image recognition apps such as Snap Fashion and ASAP54 are available to build search engines. Imagine a user taking a picture of someone wearing a dress that he has liked, or something as abstract as a painting, and the image-recognition search engine searching the huge database of products that can be bought to make available the desired or similar items. This online shopping experience could be overwhelming for customers.

As online shopping continues to grow, it is imperative for companies to utilise tools that can help them attract and retain customers. AI can serve as a communication platform to update customers on collection releases and product availability. It can provide interactive storytelling and unique digital experiences with the help of creative algorithms. Also, it can strengthen e-commerce by tracking users' preferences and giving them a customised shopping experience.

An AI machine will crunch fashion data related to millennial, current colour and silhouette trends, trend forecasts for the next season, what movie stars are wearing and such similar information, and suggest in a matter of seconds several options to choose from. In comparison, a fashion designing team working manually will take many days to come up with such suggestions. In fact, some experts feel that artificial intelligence systems have now reached a stage where they could well replace the human fashion stylists! **EFY**

LOW COST LCD / LED MODULES

LC035

LC135

Specifications

3½ Digits, 1999 Counts (max.) LCD	3½ Digits, 1999 Counts (max.) LED
LC035	LC135
0 - 200mV DC 0 - 2, 20, 200V DC 0 - 200µA DC	0 - 2, 20, 200mA DC
Auxiliary Power Supply	
9VDC $\pm 10\%$	5VDC $\pm 10\%$

Applications

• Ammeter	• Watt Meter
• Voltmeter	• LUX Meter
• Thermometer	• LCR Meter
• Power Supply	• Capacitance Meter
• PH Meter	• Other Industrial and Domestic uses.
• DB Meter
