- Remote monitoring of vending machine operations from a single control centre provides sales and inventory figures in real time

Machine-to-machine (M2M) learning and the Internet of Things (IoT) technologies present a lot of opportunities to increase business efficiency. One such opportunity exists in the retail vending machines segment.

A medium to large retail facility in India, with an average weekly footfall of about 2000, requires four to six vending machines for basic products. The entire setup including software,

hardware and related services costs ₹ 1.5 to ₹ 3 million.

So far, the Indian retail segment has been highly labour-dependent, requiring a lot of manual procedures. Accountability and inventory management are areas of high concern for the industry. Smart vending machines address all such problems, while promising high returns on investment.

The global intelligent vending

machines market is expected to grow at 38 per cent annually up to 2021, reaching 13.34 billion US dollars by 2021—according to international research organisation Technavio.

Case study: Q3 Technologies

A company wanted to introduce new cutting-edge products and technologies that allow people to communicate with systems and hardware in the retail space.
