

was a task to make police authorities believe in AI's expertise coming from an indigenous company, that too a startup."

The main intent behind ABHED platform is to digitise all crime records that are stored in old, dusty files, scattered across state-level police departments. To do so, the team had to remove duplicate information and make digitised data easily retrievable to police forces on ground zero, in real-time, even in low-speed networks using smartphones.

Here is how ABHED works. The platform primarily distinguishes available data—input or output—into fundamental elements, that is, image, speech and text. It uses these biometric features to strike a match with existing records via AI and provides required results to police forces, in real time.

The platform is available as a mobile application to on-field officers. It can even run on 2G and 3G networks. The app is connected to centralised servers that rest with police

authorities. Primary facial recognition results are further correlated with text- and speech-based data to derive essential data like gang analysis, crime hot spots, threat detection and so on. Based on these results, the police can take immediate action.

From ideation of ABHED to its pilot launch in May 2017, the platform development took nine months. Initially launched at Alwar, deployment expanded to the rest of Rajasthan, and has now been deployed across other states, including Punjab, Uttarakhand, Uttar Pradesh and Telangana.

At present, ABHED platform

contains records of 600,000 criminals and has contributed to over 100 high-risk police cases. Overall results indicate a 25 per cent reduction in crime rates.

On development side, the main hardship faced by Rai and his team was to digitise the massive bulk of historical data from age-old manual records and to give AI the form factor that users can easily comprehend.

Rai says, "When we started, there were many conjectures in the market around AI. Yet, most people lacked the nuanced understanding of this technology. Thus, one of the early

CLASS STARTS
On 2nd Jan 2019

Ampere VLSI Academy offers an Advance VLSI Verification course in the field of Semiconductor design:

- ✓ Strong Digital/Verilog Foundation
- ✓ State of the art VLSI verification concepts
- ✓ Extensive Training on SV/UVM
- ✓ Hands on projects experience in cutting edge technologies like PCIe, DDR, AXI Interconnect, SOC Verification
- ✓ Access to Industry Standard Tools
- ✓ Lectures by Industry experts
