

CHOOSING CLOUD-POWERED PLUG-AND-PLAY HOME SECURITY CAMERAS

Paromik Chakraborty

Plug-and-play devices are quite handy for households. These save time, money and effort in installation, and get into action anytime and anywhere. Latest wireless security cameras have also joined the list of plug-and-play electronics. The rise of IP-based cameras with real-time feed has enabled modern nuclear families to ensure safety of their children, pets and homes.

Another important factor

that drives the popularity of home security cameras is their mobile-based usage mode that come with cloud-based storage facilities.

Important features

Modern security cameras are lightweight, easily installable and provide multiple smart features. While selecting a security camera, it is important to check the recording quality and field-of-view (FOV) that the camera can facilitate. Recording resolution should be at least of HD quality (720 pixels) and have a 120-degrees FOV to get clear and wide views of the intended premises. Higher video resolution provides clearer imagery at the cost of higher storage space.

While live-streaming of video feed is a mandatory feature for IP cameras, storage of the feed is also important for followups on events or incidents. Cloud-based storage is the most beneficial option in this aspect, as this feature allows users to access stored videos from anywhere, remotely.

SD card-based storage is another option in security cameras. However, with this, space becomes limited and may get quickly exhausted, unless the SD card is of at least 256GB. Cloud storage, on the other hand, can be expanded as per requirements through subscriptions.

Cloud storage is a better option for data safety, too. Unlike physical storage options like SD cards that can be destroyed along with the data, a cloud-based camera sends data instantly to a remote server, keeping it safe, even if the physical camera gets harmed. Many devices offer both storage modes.

Cameras are connected using Wi-Fi, making data transmission reliable, secure and consistent. In addition to these features, other features should also be considered. One is availability of night-vision capability. It is advisable to go for a device that can record both coloured and black-and-white videos in night-vision mode, to have a detailed view of the premises.

Mobile-based usage can also be advantageous, as mobile-compatible devices can send real-time alerts, support two-way audio-video interaction, enable remote control and
