Business Setup For E-WASTE RECYCLING

With India's e-waste generation expected to grow at 30 per cent annually, there is a huge business opportunity in e-waste recycling

Research Team, ComConnect Consulting

The information and communication technology sector has witnessed unprecedented growth in the last decade across the world. Increased penetration of electronics in everyday products and increased adoption of electronics products by people have fueled this tremendous growth.

Increased consumer demand has also resulted in increased investment in product innovation, leading to shorter life-cycle of products. Over time, this has resulted in the rapid generation of a voluminous amount of electronic waste (e-waste).

E-waste is now the fastest growing waste stream, with computer equipment accounting for almost 70 per cent of it, followed by telecommunication equipment (12 per cent), electrical equipment (8 per cent) and medical equipment (7 per cent).

E-waste, needless to say, represents an enormous environmental hazard. However, it also presents huge opportunities for entrepreneurs willing to take the plunge. According to a recent study by ASSOCHAM-Cinetics, India is the fifth largest e-waste producer and its e-waste generation is expected to annually grow at 30 per cent to touch 5.2 million metric tonnes (MT) per annum by 2020 as against the present level of 1.8 million metric tonnes. This, in turn, represents a huge business opportunity in e-waste recycling.

This project report provides a brief overview of e-waste recycling business requirements.
