

end-to-end security leveraging the latest technologies, policies and best practices in an ever changing environment. A data security policy needs definition from the conceptual stage with vulnerability analysis of the data to attacks. Not just one type of security is enough. This means multiple security layers must be implemented. In the absence of policy and standards that govern IoT implementations, developers must ensure use of the best practices.

Without being a crypto-expert, one must seamlessly integrate security into network and end devices. Only the necessary data must be collected, retained and disposed of—all securely, keeping in mind user access rights. The good news is that there are solutions to do this—the Nebulae Framework is one such solution.

Q. SLS team has been focusing on the Nebulae platform recently. How

would you explain the same to IoT solution developers?

A. As the IoT has gained popularity, our customers have been asking us for solutions. At first, the solutions we provided were specifically built to meet customer needs. Unfortunately, the work performed wasn't repeatable. So for the next client, we needed to start from scratch again. That's when we decided to invest in creating a common interface between devices, which could talk across different communication networks and, being held together with the most relevant and flexible middleware, would help us build hybrid networks in order to develop, manage and integrate a variety of IoT solutions; thus Nebulae was born.

Connecting hundreds, let alone millions, of devices proves difficult when keeping in mind communication protocols, security, guaranteed message delivery, hardware and

software updates.

Nebulae provides a platform wherein IoT solution developers can quickly and easily develop their solution and focus on delivering the business logic.

Q. What are the top application areas for Nebulae?

A. There are so many IoT applications that have an opportunity to solve India's entrenched problems; in cities, healthcare and agriculture. However, the greatest impact is in manufacturing. Nebulae can not only deliver Make In India but also add an intelligent, secure and scalable framework allowing factories to make a technological leap into Industry 4.0 such that we can compete globally. Nebulae allows for customised, predictive maintenance solutions, and optimisation solutions based on the ground realities in India, ultimately saving money and creating a better product. **EFY**
