

SUSPENSE

Are You In Suspense?

Are you wondering what happened to your order or payment, even after a fortnight? But did you mention your name and address clearly while sending payment, and what the payment was for?

We get several payments every month without adequate instructions or even identity of the person sending the payment. As a result we are unable to take appropriate action on these, till we get a complaint - if at all.

At EFY, we want you to be our satisfied customer. So please do let us know in case your payment or instructions are not even acknowledged within a fortnight. We are not that lazy!

EFY GROUP
Technology Drives Us

Fig. 2: How signal boosters work

Fig. 3: An omni-directional indoor antenna

flow direction (omnidirectional or unidirectional) of the antenna and gain in dBi.

External antenna should be preferably omnidirectional, that is, it should support 360-degree to-and-fro signal flow of multiple carrier networks. The gain should be over 5dBi. Unidirectional antenna, called Yagi antenna, is good for individual or residential use in remote areas due to its superior reach to tower signals and single-carrier support.

Internal antenna should be omnidirectional dome type. These antennae transmit and receive signals in all directions. There is another category called panel antenna, which supports unidirectional flow of the transmitted signal. Select it if you have specific requirements only. Look for a gain of around 3dBi.

Price in the Indian market

In the Indian market, the average cost of cellular boosters ranges between ₹ 13,000 and ₹ 22,000 for 3G support and around ₹ 30,000 for 4G support. Some examples include:

1. Max mobile signal amplifier by Mobile Boosters India supports 3G coverage with up to 60dB gain and output

power of 20dBm. It costs around ₹ 22,000.

2. AVA Systems offers Ledmate LM-604 3G cellphone booster, which supports all service providers with 60dB gain and 23dBm output. It costs around ₹ 21,000.

3. Mobile signal boosters by Ultra-mind Technologies India support all 4G-compatible providers (only Jio support needs to be verified) with 65dB gain. The device costs around ₹ 30,000.

The list of signal boosters available in the market is quite exhaustive. You may select one by thoroughly evaluating these based on your requirements, vendor reliability and the cost of the device.

Important points to remember

1. Signal boosters amplify the existing signal strength to provide coverage. If original signal is unavailable or much weaker than the minimum threshold, boosters will not work.

2. Affirm legal compliance as well as compatibility support from your network service provider.

3. Many vendors in the market claim that 4G is not supported currently due to frequency incompatibility. So verify frequency support with the device vendor as well as the service provider.

4. Determine the coaxial cable length based on the position planned for fixing the external antenna and indoor equipment. Keep in mind that transmission through cables causes a loss of signal strength by up to 5dB.

5. Affix the external antenna firmly as it will be exposed to different weather and wind conditions.

6. Ensure enough distance separation between external and internal antennae to avoid reverberations and unclarity. **EFY**
