

Does Your OFFICE Intuitively LIGHT Itself?

► **Connected LED lighting can cut energy consumption by up to 80 per cent compared to conventional lighting**

Your work environment plays a huge role in increasing or decreasing your productivity. The ambience, the texture, the noise and colours—everything around you influences your senses and sets your mood. Sometimes we notice the effect, mostly we don't. Various researches around the world have time and again proved that everything in our working space impacts our focus and output. Among those factors, light and warmth play a key role.

Latest smart and connected lighting solutions go a step further to make offices smart. Sunil Joshi, vice president and managing director, Philips Lighting India, shares, "Technology has become increasingly people-centric and supported by powerful connec-

tivity, the Internet of Things (IoT) is driving new ways to collaborate, innovate and socialise. The same is now true in a smart building environment, where lighting is going beyond just illumination and aesthetics to help create smarter and more intelligent workspaces that offer higher occupant comfort, flexibility and profitability."

Making your office smart

Smart lighting for office spaces provides more than just cost and energy saving benefits. Anuj Dhir, vice president and business head, Wipro Commercial Lighting, explains, "In modern workspaces, new technology features enable performance tracking with real-time updates on lighting system status. These also provide real-time

updates as well as historical data and analysis of occupancy in workspaces to continually improve operations and experiences, thus helping facility managers to gain insights and, in turn, manage spaces effectively."

Specifically, centralised monitoring and control, easy and quicker maintenance, power savings, higher reliability and greater system efficiency are the benefits of technology-based lighting solutions for smart cities. Remote-controlled operation facilitates ease of maintenance for city administrators, while real-time energy metering and report generation help to analyse and decide optimal electricity usage.

Explaining the technology, Ripu Daman Sharma, country sales manager, Lutron Electronics, says, "Wireless lighting utilises the intelligence of software technology and sensors to make people's lives simpler and convenient. It is designed for energy efficiency. The technology allows LEDs to sense where the light is needed and accordingly set different colours and intensity of light. Simply put, smart or wireless lighting is associated with a system that provides centralised lighting control."

"Connected lighting can also offer various insights about a building by integrating seamlessly with IT systems in the building, demonstrating how dynamic buildings can become smarter and more efficient than ever before. Connected luminaires can be fitted with sensors that can enable managers to track occupancy patterns, changes in temperature, light levels, and much more while employees can personalise the lighting around their desks. The system provides maximum visibility and better control, and allows offices to
