

SMART NOTEBOOKS

THAT LAST ALMOST FOREVER

Paromik Chakraborty

We all wish for a notebook that never runs out of paper. Finding the relevant notes amidst a sea of pages calls for technology to help. Around the world, there are some interesting products that are answering the paper woes. Let's take a look at some of them.

Rocketbook Everlast

Rocketbook Innovations, cofounded by Joe Lemay and Jake Epstein, has come up with a smart paper-and-pen notebook that's endlessly reusable.

Writing on the Everlast smart notebook is no different from the traditional ones. The fun part, however, is that the Rocketbook mobile application can scan and send the written notes to your selected cloud location. Also, the inks can be wiped off with a moist cloth, making the book as good as new.

For the paper reusability feature to work, you need a pen from Pilot's FriXion gel ballpoint series. Everlast's pages are made of a certain synthetic polyester mixture. The ink of FriXion pens is made of special dye and chemical compounds that complement the polyester paper.

At the bottom of the pages seven different symbols are scribbled. On the Rocketbook mobile application each of these symbols can be pre-routed to a particular cloud service of your choice. (Supported services include Google Drive, Dropbox, Evernote, Slack and even e-mail.) Once the writing is done, mark the desired symbol on the paper. The symbol helps the app to determine the destination folder where the scanned

image needs to be saved, and the file is stored likewise in sequential order (determined by a QR Code present on the corner of each page).
