TVS diode arrays

Littelfuse, Inc. has introduced 16 series of automotive-qualified TVS diode arrays (SPA diodes) that are Production Part Approval Process (PPAP) capable. These offer automakers and high-end industrial manufacturers single-origin flow from wafer creation through testing of the devices used in their products. The AEC-Q101 qualified devices offer a durable approach for current and emerging interfaces in the automotive ecosystem for data lines, charging lines, control lines and drivetrain, as well as for communication ports, including antennae, against damage due to electrostatic discharges, electrical fast transients and other over-voltage transients.

CAN transceivers

Maxim's new 2.75kV and 5kV family of isolated controller area network (CAN) transceivers help designers to ensure robust communication and improve uptime for industrial systems. The high-speed transceivers integrate up to 5kV integrated galvanic isolation with fault protection and ± 15 kV human body model (HBM) ESD to increase uptime in harsh and noisy environments. These operate up to the maximum high-speed CAN data rate of 1Mbps and feature ± 54 V fault protection on receiver inputs.

Camera solution for cars

Renesas Electronics and HELLA Aglaia have announced their open and scalable front camera solution for advanced

driver-assistance systems (ADAS) and automated driving. The new front camera solution combines R-Car V3M, Renesas' high-performance, low-power image-recognition system-on-chip (SOC) for New Car Assessment Program (NCAP, Note 1), and HELLA Aglaia's field-proven camera software designed

to meet level 2 (partial automation) and level 3 (conditional automation) of SAE International's new J3016 standard (Note 2). Designed for scalability, the solution enables system designers to build a wide range of front cameras, from cameras supporting NCAP to cameras supporting up to level 3 applications.

Biosensor

MediaTek Sensio MT6381 is a 6-in-1 smartphone biosensor module that makes it easy to track heart rate, blood pressure, peripheral oxygen saturation levels and more. Available as an embedded module in smartphones, it allows consumers to quickly check and monitor physical wellness on a device they use the most—their smartphone.

MediaTek Sensio MT6381 is a comprehensive solution consisting of optical, electrical and processing components. Its customisable, compact design means device manufacturers have the flexibility to embed it directly into all types of smartphones, versus using multiple sensors. With MediaTek Sensio, manufacturers are able to develop proprietary applications or leverage third-party applications and developer add-ons.

3D printing filaments

Rever Industries offers 3D printing filaments in materials ranging from PLA, ABS, PETG, Wood, Glow-in-the-dark HIPS and TPU, and in a wide range of colours of your choice. These filaments have diameter tolerance as good as ± 0.03 mm and consistent colour shades.

Security controllers

Infineon Technologies has introduced a one-stop offering for fast and easy production of payment cards and smart wearables. Launched under the brand SECORA Pay, the new contact and dual-interface EMV security controllers come with the latest EMV applets. Coming in various versions, these allow a flexible approach to regional market requirements, thus significantly easing the adoption of EMV-compliant payment cards and emerging form factors such as smart wearables.

TEST & MEASUREMENT

Multifunction meters

MECO has introduced an all-new PowerGuard (PG08T) with built-in timer and relay function for load power on/off, tariff and money function to know spending/saving on electricity, three-pin socket and plug suitable for Indian sockets (external adaptor not required), bigger LCD with backlight and large digits, and beautiful design in bright white colour.

This meter can measure power (W), power factor (PF), carbon emission (CO₂ in kg), total used time (min),
