

THE LATEST WIRELESS SPEAKERS WITHIN ₹ 15,000

Astrum ST250 Bluetooth clock speaker

faster with a much lower chance of interference by other electronic equipment. It provides a high range of coverage (as far as the Wi-Fi network can cover).

Additionally, you can stream various online audio services (SoundCloud, Spotify, etc) directly through these systems. However, if you would like to set up your Wi-Fi speaker system somewhere else, you will have to re-configure the speakers with the new Wi-Fi connection in the area, which can be somewhat time taking. Wi-Fi speakers are comparatively costlier as well.

Bluetooth speakers have come a long way in terms of audio quality and performance. With the introduction of AptX technology (Qualcomm-owned audio-quality-enhancement algorithm) on top of Bluetooth's Advanced Audio Distribution Protocol (A2DP), Bluetooth speakers have broken the jinx of low-quality audio transmission. These are very easy to set up, and Bluetooth's ubiquity allows you to carry and play these anywhere, anytime.

While these are more budget-friendly, multiple speakers cannot be connected simultaneously using a single smartphone. Moreover, these have a limited coverage range of 10 metres (33-feet), which may be obstructed by walls.

In short, Wi-Fi speakers are the more desired solution for home audio systems for a multi-room setup. Whereas, Bluetooth speakers are a more economical option and a better companion for frequent movers.

How great would it be if you could carry your speaker just about anywhere and set it up instantly? How about controlling your playlist from your smartphone from anywhere in your room? These are a few features that make wireless speakers so desirable today. If you are planning to purchase wireless speakers, here are the features you should look out for.

Which wireless mode to choose

Connectivity of modern speakers comes from various wireless technologies, including Wi-Fi, Bluetooth and Near Field Communication (NFC). Among these, the first two are the most popular.

Wi-Fi-enabled speakers are highly productive in terms of sound quality and coverage. In a given Wi-Fi network, you can set up multiple speakers and run the same or different audio files across all of these, simultaneously.

Moreover, with advanced protocols of Wi-Fi (called 802.11ac standard), data transmission has become
