

SiC.

A next-Gen semiconductor that traveled 4.6 billion years to get here.

The latent power of SiC is brought to life through our passionate engineers.

Traces of Silicon Carbide (SiC) in meteorites dates back over 4.6 billion years, older than our Solar system. SiC manufacturing with superior semiconductor properties, baffled even top researchers in the world.

ROHM began pioneering the mass production of SiC power devices in the 1990s. At the time, in the absence of a well-equipped research environment, ROHM went on daily excursions to research facilities through-out the country. Even as the state of the global economy

worsened they dedicated themselves to improving the production line and creating original testing methodology while increasing processing accuracy. With the World's first mass production of SiC DMOS in 2010, ROHM's passion for betterment of society bears fruit.

As a leader in SiC power devices, ROHM will continue to meet new challenges, committed to reaching even higher standards of quality and expanding research over a broad range of fields.

What are SiC Power Devices ?

SiC, a compound semiconductor composed of Silicon (Si) and Carbon (C), involves innovative manufacturing process that requires extremely high temperatures to produce crystals. SiC power devices deliver superior energy savings for high power conversion, in industrial equipment, Solar inverters, Consumer appliances and Automotive EV (Electric Vehicles).

SiC power device
