

OVER THE AIR UPDATES

The integral part of
IoT systems

In today's world, where Industry is knocking doors for 4.0 and becoming smart with the help of IoT automation whether it is your fully automatic car, cool gadgets like a smartwatch or industrial CNC like a machine. Due to innovation emerging at an exponential pace firmware must be kept in constant development to remove bugs and improve functionality. An over-the-air firmware update system is preferable as it allows for the faster update and encourages accessibility for the development. Companies often ignore the securities of FOTA (Firmware Over The Air) with the network or peripheral connections and outcome are like a disaster.

Considering the threats, Nebulae allows you to reliably deliver software updates. Nebulae Gateways and Nodes do the firmware update over secure PKI based channel with a fail-safe support having bandwidth controls. Nebulae Middleware supports, secure and robust FOTA for gateways and nodes.

Functionality

- Robust, Reliable, and fail-safe with replay attack protection (Botnet)
- 3 Layer Verification: Authentication, Integrity, and Sanity (Ddos & Identity Theft)
- Secure with PKI (Man-in-the-middle)
- Requires Zero configuration
