

dows installation CD. (If you do not have one, you can purchase one easily.) It will ask where it should install Windows. Choose the location.

Once finished, your Mac will boot into Windows for the first time. Going forwards, every time you turn your machine on, hold down Option key and choose between Windows and Mac. Remember, you cannot switch between the two operating systems on the go. So, make sure you choose the right one, or you will have to restart the machine.

Create smart folders to automatically categorise files

A regular folder is something you create and store files in, manually. Whereas, a smart folder is one whose contents are partly or completely determined by a set of rules that you decide. It can be a very helpful tool for someone like me who takes hundreds of screengrabs each day, from bills paid to one-page articles that I want to save. I have a smart folder that saves all the screenshots I have taken in a month, which I go through at the end of each month and decide what to discard and what to keep.

To create a smart folder, open Finder, click on File menu and select New Smart Folder. It will open a folder where you can set rules as per your requirement. To add rules, click on (+) icon and set your preferences.

Ctrl + Alt + Delete

Mac OS comes with its own version of Ctrl + Alt + Delete, for closing applications that are hung. If you cannot exit a program by closing the window, hold down Command + Option + Esc. This will open Force Quit Applications dialogue box, which will show you all the applications that are running. Choose the one you want to close and Viola!

Merge Finder windows

Anyone who uses Mac knows that each time you want to look up something in Finder, it opens a new window. This can get messy if you have multiple Finder windows open at one time. To combine all windows

in one, click on Windows option in Menu and select Merge All Windows. Now all windows will show as tabs within one Finder window.

Record your screen

I know people who like saving every little thing! They even like saving voice/video conversations they have with their loved ones. Did you know that iOS 11 lets you record your screen, and effectively allows you to save all your FaceTime conversations, among other things?

To record your screen, open QuickTime Player, which comes preinstalled on all Macs. From File menu, choose New Screen Recording. Screen Recording box will pop up on the screen. Click on the white down arrow for more options. Choose whether to use the built-in microphone or an external microphone for audio. You can also choose whether your mouse clicks should show up. Once you are done, right-click on QuickTime icon in Dock and choose Stop Recording from the menu. Finally, save the clip in a folder of your choice.

This feature can be used to record voiceovers for videos, selected parts of the screen and much more.

Create custom keyboard shortcuts

Keyboard shortcuts come in handy and allow you to get more work done in lesser time. Most apps come with their own inbuilt keyboard shortcuts, but Mac operating system lets you create your own. This feature has helped me become more productive over the years.

To create a shortcut, go to System Preferences → Keyboard → Shortcuts → App Shortcut. Click on + button and follow the instructions on the screen to create your own shortcut.

This is obviously not an exhaustive list. Even after 10 years, I am sure I have not been able to discover even 50 per cent of the features that this wonderful piece of machinery has to offer. Write to us and let us know of some interesting tips and tricks that you have found useful in your Mac. **EFY**
