

Global AI business value to reach US\$ 1.2 trillion in 2018

According to Gartner Inc., global business value derived from artificial intelligence (AI) is projected to total US\$ 1.2 trillion in 2018, an increase of 70 per cent from 2017. AI-derived business value is forecast to reach US\$ 3.9 trillion in 2022.

The Gartner AI-derived business value forecast assesses the total business value of AI across all enterprise vertical sectors covered by Gartner. There are three different sources of AI business value: customer experience, new revenue and cost reduction.

“AI promises to be the most disruptive class of technologies during

the next 10 years, due to advances in computational power, volume, velocity and variety of data, as well as advances in deep neural networks,” says John-David Lovelock, research vice president at Gartner.

He adds, “One of the biggest aggregate sources for AI-enhanced products and services acquired by enterprises between 2017 and 2022 will be niche solutions that address one need very well. Business executives will drive investment in these products, sourced from thousands of narrowly-focused, specialist suppliers with specific AI-enhanced applications.”

On The Move

Manish Misra joins Panasonic India

Panasonic India has appointed Manish Misra as its chief innovation officer. He will be responsible for the strategic development of innovation and technology while leading the company's innovation hub—The Centre of Excellence—in India. The innovation hub aims to develop the company's transformative solutions in five key domains, namely, connected home/community, mobility, energy, industrial and finance solutions.
