(2G, 4G, LTE-M/NB-IoT, etc) to achieve up to 10 years of battery life, IoT expansion card slot to plug in any technology based on IoT expansion card open standard, integration with AirVantage IoT platform to create, deploy and manage solutions in the cloud, and built-in

Wi-Fi b/g/n and Bluetooth 4.2 BLE with Cortex M4 to provide real-time access to I/O. Next, we are working on massive enablement of next-generation low power wide area (LPWA) applications for LTE-M and NB-IoT.”

Accurate sensor operation relies on

careful designing of software and hardware interfaces to meet specific performance requirements. Developers need to carefully consider the placement of the sensor on the board as well as the nature of the housing used to protect sensitive sensors, and optimise sensor accuracy and reliability. For multi-sensor IoT applications, developers need to address issues for each separate sensor to avoid electrical or physical interaction among sensors in the final board design. They need to pay attention at each stage of software and hardware design to achieve reliable humidity and temperature data.

Due to an explosion in the availability of small, inexpensive computing hardware, the IoT is developing at a rapid pace. IoT development boards combine micro-controllers and processors with wireless chips and other components in a pre-built, ready-to-program package. There is sure to be a board that fits your exact requirements, whatever the needs of your product or project. **EFY**

TME: Those Who Opened A Shop In Poland Now Sell Electronic Components All Over The World

Human history is full of inventions, such as the wheel, steam engine or bulb. As years went by, a telephone and a TV set were invented. This would have been impossible without electronic components.

Almost 30 years ago, Transfer Multisort Elektronik (TME) began its journey through the world of components. It took its first steps in a local electronics market. After some time, the first shop was opened, then a wholesale store and eventually a head office, accompanied by a logistics and warehouse centre. Currently, TME is one of the biggest global distributors of electronic and electrotechnic components, workplace equipment and industrial automation.

Since its foundation, the team has been constantly growing—it now consists of over 700 people. The people work in the head office in Poland and 10 foreign subsidiaries. In the future, new offices will open in the USA, India and Australia.

Sending a package abroad was a challenge when the company was first set up. Today, the Export Department serves companies from over 140 countries and sending parcels to countries such as Djibouti is no surprise anymore.

The entire team works every day to break records, in terms of the number of products on offer, packages sent or countries served. TME delivers components for IA mines, satellites, and robots playing football or high-speed trains, among others.
